AP® CALCULUS AB/CALCULUS BC 2016 SCORING GUIDELINES

Question 1

| t (hours) | 0 | 1 | 3 | 6 | 8 |
|---------------------------------------|------|------|-----|-----|-----|
| $\frac{R(t)}{(\text{liters / hour})}$ | 1340 | 1190 | 950 | 740 | 700 |

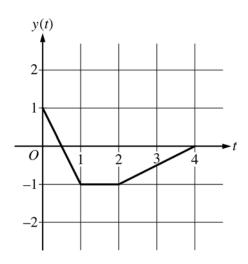

Water is pumped into a tank at a rate modeled by $W(t) = 2000e^{-t^2/20}$ liters per hour for $0 \le t \le 8$, where t is measured in hours. Water is removed from the tank at a rate modeled by R(t) liters per hour, where R is differentiable and decreasing on $0 \le t \le 8$. Selected values of R(t) are shown in the table above. At time t = 0, there are 50,000 liters of water in the tank.

- (a) Estimate R'(2). Show the work that leads to your answer. Indicate units of measure.
- (b) Use a left Riemann sum with the four subintervals indicated by the table to estimate the total amount of water removed from the tank during the 8 hours. Is this an overestimate or an underestimate of the total amount of water removed? Give a reason for your answer.
- (c) Use your answer from part (b) to find an estimate of the total amount of water in the tank, to the nearest liter, at the end of 8 hours.
- (d) For $0 \le t \le 8$, is there a time t when the rate at which water is pumped into the tank is the same as the rate at which water is removed from the tank? Explain why or why not.

| (a) | $R'(2) \approx \frac{R(3) - R(1)}{3 - 1} = \frac{950 - 1190}{3 - 1} = -120$ liters/hr ² | 2 : $\begin{cases} 1 : \text{estimate} \\ 1 : \text{units} \end{cases}$ | | |
|--|--|---|--|--|
| (b) | The total amount of water removed is given by $\int_0^8 R(t) dt$. $\int_0^8 R(t) dt \approx 1 \cdot R(0) + 2 \cdot R(1) + 3 \cdot R(3) + 2 \cdot R(6)$ = 1(1340) + 2(1190) + 3(950) + 2(740) = 8050 liters | 3 : | | |
| | This is an overestimate since R is a decreasing function. | | | |
| (c) | Total $\approx 50000 + \int_0^8 W(t) dt - 8050$ = 50000 + 7836.195325 - 8050 \approx 49786 liters | 2 : $\begin{cases} 1 : integral \\ 1 : estimate \end{cases}$ | | |
| (d) | W(0) - R(0) > 0, $W(8) - R(8) < 0$, and $W(t) - R(t)$ is continuous. | 2 : $\begin{cases} 1 : \text{ considers } W(t) - R(t) \\ 1 : \text{ answer with explanation} \end{cases}$ | | |
| | Therefore, the Intermediate Value Theorem guarantees at least one time t , $0 < t < 8$, for which $W(t) - R(t) = 0$, or $W(t) = R(t)$. | | | |
| | For this value of <i>t</i> , the rate at which water is pumped into the tank is the same as the rate at which water is removed from the tank. | | | |

AP[®] CALCULUS BC 2016 SCORING GUIDELINES

Question 2

At time *t*, the position of a particle moving in the *xy*-plane is given by the parametric functions (x(t), y(t)), where $\frac{dx}{dt} = t^2 + \sin(3t^2)$. The graph of *y*, consisting of three line segments, is shown in the figure above. At t = 0, the particle is at position (5, 1).

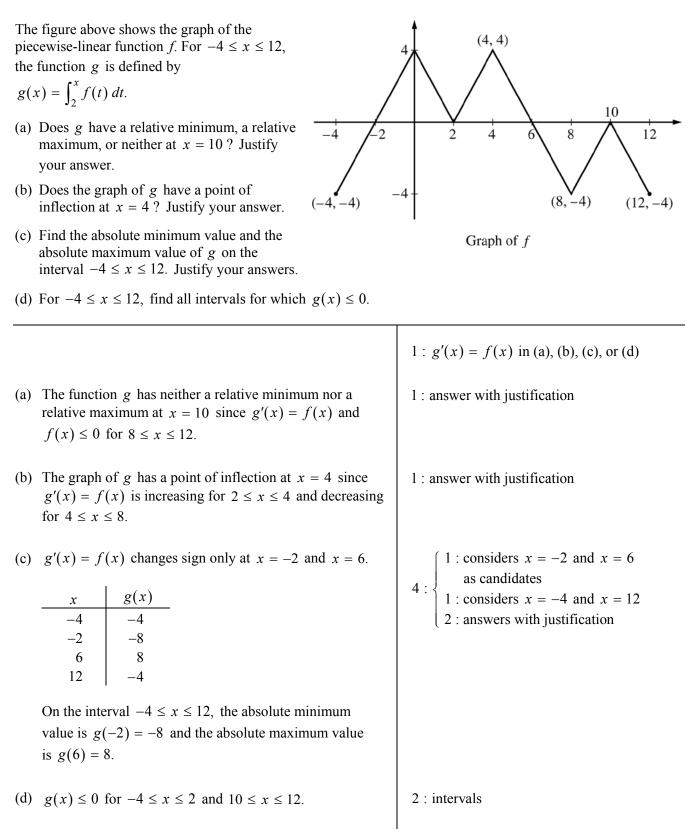

- (a) Find the position of the particle at t = 3.
- (b) Find the slope of the line tangent to the path of the particle at t = 3.
- (c) Find the speed of the particle at t = 3.
- (d) Find the total distance traveled by the particle from t = 0 to t = 2.

| (a) | $x(3) = x(0) + \int_0^3 x'(t) dt = 5 + 9.377035 = 14.377$ $y(3) = -\frac{1}{2}$ The position of the particle at $t = 3$ is (14.377, -0.5). | 3 : |
|-----|---|--|
| (b) | Slope $=\frac{y'(3)}{x'(3)} = \frac{0.5}{9.956376} = 0.05$ | 1 : slope |
| (c) | Speed = $\sqrt{(x'(3))^2 + (y'(3))^2} = 9.969$ (or 9.968) | 2 : $\begin{cases} 1 : expression for speed \\ 1 : answer \end{cases}$ |
| (d) | Distance = $\int_0^2 \sqrt{(x'(t))^2 + (y'(t))^2} dt$ = $\int_0^1 \sqrt{(x'(t))^2 + (-2)^2} dt + \int_1^2 \sqrt{(x'(t))^2 + 0^2} dt$ = 2.237871 + 2.112003 = 4.350 (or 4.349) | 3 : |

AP[®] CALCULUS AB/CALCULUS BC 2016 SCORING GUIDELINES

Question 3

AP[®] CALCULUS BC 2016 SCORING GUIDELINES

Question 4

Consider the differential equation $\frac{dy}{dx} = x^2 - \frac{1}{2}y$.

(a) Find $\frac{d^2 y}{dx^2}$ in terms of x and y.

- (b) Let y = f(x) be the particular solution to the given differential equation whose graph passes through the point (-2, 8). Does the graph of f have a relative minimum, a relative maximum, or neither at the point (-2, 8)? Justify your answer.
- (c) Let y = g(x) be the particular solution to the given differential equation with g(-1) = 2. Find $\lim_{x \to -1} \left(\frac{g(x) - 2}{3(x+1)^2} \right)$. Show the work that leads to your answer.
- (d) Let y = h(x) be the particular solution to the given differential equation with h(0) = 2. Use Euler's method, starting at x = 0 with two steps of equal size, to approximate h(1).

(a)
$$\frac{d^2 y}{dx^2} = 2x - \frac{1}{2} \frac{dy}{dx} = 2x - \frac{1}{2} \left(x^2 - \frac{1}{2}y\right)$$
(b)
$$\frac{dy}{dx}\Big|_{(x, y)=(-2, 8)} = (-2)^2 - \frac{1}{2} \cdot 8 = 0$$

$$\frac{d^2 y}{dx^2}\Big|_{(x, y)=(-2, 8)} = 2(-2) - \frac{1}{2} ((-2)^2 - \frac{1}{2} \cdot 8) = -4 < 0$$
Thus, the graph of *f* has a relative maximum at the point (-2, 8).
(c)
$$\lim_{x \to -1} (g(x) - 2) = 0 \text{ and } \lim_{x \to -1} 3(x + 1)^2 = 0$$
Using L'Hospital's Rule,

$$\lim_{x \to -1} \left(\frac{g(x) - 2}{3(x + 1)^2}\right) = \lim_{x \to -1} \left(\frac{g'(x)}{6(x + 1)}\right)$$

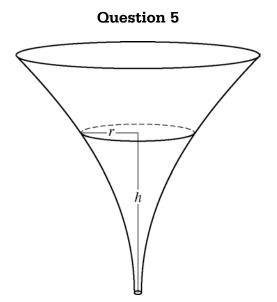

$$\lim_{x \to -1} g'(x) = 0 \text{ and } \lim_{x \to -1} 6(x + 1) = 0$$
Using L'Hospital's Rule,

$$\lim_{x \to -1} g'(x) = 0 \text{ and } \lim_{x \to -1} 6(x + 1) = 0$$
Using L'Hospital's Rule,

$$\lim_{x \to -1} \left(\frac{g'(x)}{6(x + 1)}\right) = \lim_{x \to -1} \left(\frac{g''(x)}{6}\right) = \frac{-2}{6} = -\frac{1}{3}$$
(d)
$$h\left(\frac{1}{2}\right) \approx h(0) + h'(0) \cdot \frac{1}{2} = 2 + (-1) \cdot \frac{1}{2} = \frac{3}{2}$$

$$h(1) \approx h\left(\frac{1}{2}\right) + h'\left(\frac{1}{2}\right) \cdot \frac{1}{2} \approx \frac{3}{2} + \left(-\frac{1}{2}\right) \cdot \frac{1}{2} = \frac{5}{4}$$
2 : $\begin{cases} 1 : \text{Euler's method} \\ 1 : \text{ approximation} \end{cases}$

AP[®] CALCULUS AB/CALCULUS BC 2016 SCORING GUIDELINES

The inside of a funnel of height 10 inches has circular cross sections, as shown in the figure above. At height h, the radius of the funnel is given by $r = \frac{1}{20}(3+h^2)$, where $0 \le h \le 10$. The units of r and h are inches.

- (a) Find the average value of the radius of the funnel.
- (b) Find the volume of the funnel.
- (c) The funnel contains liquid that is draining from the bottom. At the instant when the height of the liquid is h = 3 inches, the radius of the surface of the liquid is decreasing at a rate of $\frac{1}{5}$ inch per second. At this instant, what is the rate of change of the height of the liquid with respect to time?

(a) Average radius
$$= \frac{1}{10} \int_{0}^{10} \frac{1}{20} (3+h^2) dh = \frac{1}{200} \left[3h + \frac{h^3}{3} \right]_{0}^{10}$$

 $= \frac{1}{200} \left(\left(30 + \frac{1000}{3} \right) - 0 \right) = \frac{109}{60}$ in
(b) Volume $= \pi \int_{0}^{10} \left(\left(\frac{1}{20} \right) (3+h^2) \right)^2 dh = \frac{\pi}{400} \int_{0}^{10} (9+6h^2+h^4) dh$
 $= \frac{\pi}{400} \left[9h + 2h^3 + \frac{h^5}{5} \right]_{0}^{10}$
 $= \frac{\pi}{400} \left(\left(90 + 2000 + \frac{100000}{5} \right) - 0 \right) = \frac{2209\pi}{40}$ in³
(c) $\frac{dr}{dt} = \frac{1}{20} (2h) \frac{dh}{dt}$
 $-\frac{1}{5} = \frac{3}{10} \frac{dh}{dt}$
 $\frac{dh}{dt} = -\frac{1}{5} \cdot \frac{10}{3} = -\frac{2}{3}$ in/sec
 $= \frac{\pi}{400} \left(\frac{1}{3} + \frac{1}{3} +$

AP[®] CALCULUS BC 2016 SCORING GUIDELINES

Question 6

The function f has a Taylor series about x = 1 that converges to f(x) for all x in the interval of convergence.

It is known that
$$f(1) = 1$$
, $f'(1) = -\frac{1}{2}$, and the *n*th derivative of f at $x = 1$ is given by
$$f^{(n)}(1) = (-1)^n \frac{(n-1)!}{2^n} \text{ for } n \ge 2.$$

- (a) Write the first four nonzero terms and the general term of the Taylor series for f about x = 1.
- (b) The Taylor series for f about x = 1 has a radius of convergence of 2. Find the interval of convergence. Show the work that leads to your answer.
- (c) The Taylor series for f about x = 1 can be used to represent f(1.2) as an alternating series. Use the first three nonzero terms of the alternating series to approximate f(1.2).
- (d) Show that the approximation found in part (c) is within 0.001 of the exact value of f(1.2).

| (a) $f(1) = 1$, $f'(1) = -\frac{1}{2}$, $f''(1) = \frac{1}{2^2}$, $f'''(1) = -\frac{2}{2^3}$ $f(x) = 1 - \frac{1}{2}(x-1) + \frac{1}{2^2 \cdot 2}(x-1)^2 - \frac{1}{2^3 \cdot 3}(x-1)^3 + \cdots$ $+ \frac{(-1)^n}{2^n \cdot n}(x-1)^n + \cdots$ | 4 : |
|---|---|
| (b) $R = 2$. The series converges on the interval $(-1, 3)$. When $x = -1$, the series is $1 + 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots$. | 2 : { 1 : identifies both endpoints 1 : analysis and interval of convergence |
| 2 3 4 Since the harmonic series diverges, this series diverges. | |
| When $x = 3$, the series is $1 - 1 + \frac{1}{2} - \frac{1}{3} + \frac{1}{4} + \cdots$. Since the alternating harmonic series converges, this series converges. | |
| Therefore, the interval of convergence is $-1 < x \le 3$. | |
| (c) $f(1.2) \approx 1 - \frac{1}{2}(0.2) + \frac{1}{8}(0.2)^2 = 1 - 0.1 + 0.005 = 0.905$ | 1 : approximation |
| (d) The series for $f(1.2)$ alternates with terms that decrease in magnitude to 0. | 2 : $\begin{cases} 1 : \text{error form} \\ 1 : \text{analysis} \end{cases}$ |
| $ f(1.2) - T_2(1.2) \le \left \frac{-1}{2^3 \cdot 3}(0.2)^3\right = \frac{1}{3000} \le 0.001$ | |
