

DINWIDDIE COUNTY  
*Public Schools*

# Algebra I

## Math Curriculum Guide

*Dinwiddie County Public Schools provides each student the opportunity to become a productive citizen, engaging the entire community in the educational needs of our children.*

# Algebra I Curriculum Guide

- The DCPS Curriculum Guide contains key concepts and SOL numbers for each week. These skill areas must be cross referenced with the DOE Enhanced Scope and Sequence and DOE Curriculum Framework.
- Grade Level(s): 8-9
- Prerequisite: Math 8
- Course Description:

[Virginia Department of Education Mathematics SOL Curriculum Framework](#)

[Virginia Department of Education Mathematics SOL Standards](#)

[Virginia Department of Education Mathematics 2016 SOL Standards - Effective 2018-2019](#)

## Curriculum Information

Essential Questions and Understandings  
Teacher Notes and Elaborations

Polynomials can be represented in a variety of forms. Physical representations such as Algeblocks should be used to support understanding of these concepts. A *monomial* is a constant, a variable, or the product of a constant and one or more variables. A *polynomial* is an expression of two or more terms. A *binomial* is a polynomial of two terms. A *trinomial* is a polynomial of three terms. Polynomials can be added and subtracted by combining like terms.

The following are examples of adding and subtracting polynomials:

$$(y^2 - 7y - 2) + (3y^2 + 8)$$

$$\begin{array}{r} y^2 - 7y - 2 \\ + 3y^2 \quad + 8 \\ \hline 4y^2 - 7y + 6 \end{array}$$

$$\begin{aligned} (5x - 3y - 2) - (4x - 5) &= 5x - 3y - 2 - 4x + 5 \\ &= (5x - 4x) - 3y + ((-2) + 5) \\ &= x - 3y + 3 \end{aligned}$$

## Teacher Extension

When adding or subtracting rational expressions with polynomial factors in denominators, a common denominator must be found. To simplify a rational expression, divide out any common factors of the numerator and denominator.

Example 1:

$$\begin{aligned} \frac{x+1}{x} + \frac{x-3}{3x} \\ \frac{3(x+1)}{3x} + \frac{x-3}{3x} \\ \frac{3x+3}{3x} + \frac{x-3}{3x} \\ \frac{3x+3+x-3}{3x} \\ \frac{4x}{3x} \\ \frac{4}{3} \end{aligned}$$

Example 2:

$$\begin{aligned} \frac{4}{x^2-16} + \frac{3}{x^2+8x+16} \\ \frac{4}{(x+4)(x-4)} + \frac{3}{(x+4)(x+4)} \\ \frac{4(x+4)}{(x+4)^2(x-4)} + \frac{3(x-4)}{(x+4)^2(x-4)} \\ \frac{4x+16}{(x+4)^2(x-4)} + \frac{3x-12}{(x+4)^2(x-4)} \\ \frac{7x+4}{(x+4)^2(x-4)} \end{aligned}$$

Example 3

$$\begin{aligned} \frac{x^2-3x}{x^2-5x+6} \cdot \frac{(x-2)^2}{2x} \\ \frac{x(x-3)}{(x-2)(x-3)} \cdot \frac{(x-2)(x-2)}{2x} \\ \frac{(x-2)}{2} \end{aligned}$$

| <p><b><u>SOL Reporting Category</u></b><br/>Expressions and Operations</p> <p><b><u>Topic</u></b><br/>Expressions and Operations</p> <p><b><u>Virginia SOL A.2</u></b><br/>The student will perform operations on polynomials, including</p> <ol style="list-style-type: none"> <li>a. applying the laws of exponents to perform operations on expressions;</li> <li>b. adding, subtracting, multiplying, and dividing polynomials; and</li> <li>c. factoring completely first- and second-degree binomials and trinomials in one or two variables.</li> </ol> <p>Graphing calculators will be used as a tool for factoring and for confirming algebraic factorizations.</p> | <p><b><u>Teacher Notes and Elaborations</u></b> <i>(continued)</i></p> <p>Polynomial multiplication requires that each term in the first expression will be multiplied by each term in the second expression using the distributive property. The distributive property is the unifying concept for polynomial operations. This property is better understood if students can use a physical model to help them develop understanding. The area model of multiplication should be demonstrated and used by students. Physical models to use include Algeblocks or Algebra Tiles. Students should be able to sketch the physical models, and record the process as they progress.</p> |

**Curriculum Information**

**SOL Reporting Category**

Expressions and Operations

**Topic**

Expressions and Operations

**Virginia SOL A.2**

The student will perform operations on polynomials, including

- applying the laws of exponents to perform operations on expressions;
  - adding, subtracting, multiplying, and dividing polynomials; and
  - factoring completely first- and second-degree binomials and trinomials in one or two variables.
- Graphing calculators will be used as a tool for factoring and for confirming algebraic factorizations.

**Essential Questions and Understandings**

**Teacher Notes and Elaborations**

**Teacher Notes and Elaborations** *(continued)*

The following are examples of multiplying polynomials.

$$\begin{array}{r} 5a^2 - 3a - 7 \\ \quad \quad 3a + 2 \\ \hline 10a^2 - 6a - 14 \\ 15a^3 - 9a^2 - 21a \\ \hline 15a^3 + a^2 - 27a - 14 \end{array}$$

$$\begin{aligned} (x - 4)(2x^2 - x + 3) &= x(2x^2 - x + 3) - 4(2x^2 - x + 3) \\ &= 2x^3 - x^2 + 3x - 8x^2 + 4x - 12 \\ &= 2x^3 - 9x^2 + 7x - 12 \end{aligned}$$

Area Model of  $(2y + 7)(-3y^2 + 4y - 8)$

Division of a polynomial by a monomial requires each term of the polynomial be divided by the monomial.

$$\begin{aligned} \frac{4x^4 + 8x^3y - 12x^2y^2}{4x^2} &= \frac{4x^4}{4x^2} + \frac{8x^3y}{4x^2} - \frac{12x^2y^2}{4x^2} \\ &= x^2 + 2xy - 3y^2 \end{aligned}$$

To divide a polynomial by a binomial several methods may be used such as factoring, long division, or using an area model. Factoring and simplifying is the preferred method but does not always work.

Factoring Example:

$$\begin{aligned} \frac{x^2 + 8x + 15}{x + 3} &= \frac{(x + 5)(x + 3)}{(x + 3)} \\ &= \frac{(x + 5)\cancel{(x + 3)}}{\cancel{(x + 3)}} \\ &= (x + 5) \end{aligned}$$

**Curriculum Information**

**SOL Reporting Category**

Expressions and Operations

**Topic**

Expressions and Operations

**Virginia SOL A.2**

The student will perform operations on polynomials, including

- applying the laws of exponents to perform operations on expressions;
  - adding, subtracting, multiplying, and dividing polynomials; and
  - factoring completely first- and second-degree binomials and trinomials in one or two variables.
- Graphing calculators will be used as a tool for factoring and for confirming algebraic factorizations.

**Essential Questions and Understandings**

**Teacher Notes and Elaborations**

**Teacher Notes and Elaborations** (continued)

Area Model Example:  $\frac{x^2 + 8x + 15}{x + 3} \rightarrow$  Step 1: Model the polynomial  $x^2 + 8x + 15$  (the dividend).

Step 2: Place the  $x^2$  tile at the corner of the product mat. Using all the tiles, make a rectangle with a length of  $x + 3$  (the divisor). The width of the array  $x + 5$ , is the quotient.

Long Division Example:

$$\frac{x^2 + 8x + 15}{x + 3} \rightarrow \begin{array}{r} x + 5 \\ x + 3 \overline{) x^2 + 8x + 15} \\ \underline{-(x^2 + 3x)} \phantom{+ 15} \\ 5x + 15 \\ \underline{-(5x + 15)} \\ 0 \end{array} \rightarrow x + 5$$

| Curriculum Information | Essential Questions and Understandings<br>Teacher Notes and Elaborations  |
|------------------------|---|
|                        | <p><b><u>Extension for Algebra I</u></b><br/>When finding the quotient of polynomials, if the polynomial cannot be factored or if there are no common factors by which to divide, long division must be used.</p> <p><b><u>Teacher Notes and Elaborations</u></b> <i>(continued)</i><br/>Factoring is the reverse of polynomial multiplication. The same models for multiplication can be used to factor. A factor of an algebraic polynomial is one of two or more polynomials whose product is the given polynomial. Some polynomials cannot be factored over the set of real numbers and these are called <i>prime polynomials</i>. If the graph of a quadratic function does not cross the <math>x</math>-axis it is a prime polynomial. There is a relationship between the factors of a polynomial and the <math>x</math>-intercepts of its related graph. The <math>x</math>-<i>intercept</i> is the point at which a graph intersects the <math>x</math>-axis. Polynomial expressions in a variable <math>x</math> and their factors can be used to define functions by setting <math>y</math> equal to the polynomial expression or <math>y</math> equal to a factor, and these functions can be represented graphically.</p> <p><b>Guidelines for Factoring</b></p> <ol style="list-style-type: none"> <li>1. Factor out the greatest monomial factor first.</li> <li>2. Look for a difference of squares.</li> <li>3. Look for a trinomial square.</li> <li>4. If a trinomial is not a square, look for a pair of binomial factors.</li> <li>5. If a polynomial has four or more terms, look for a way to group the terms in pairs or in a group of three terms that is a binomial square.</li> <li>6. Make sure that each factor is prime. Check the work by multiplying the factors.</li> </ol> <p>Using a graphical representation of a polynomial, it is possible to determine the apparent factors and to identify the zeros of the function. (Note: Students sometimes confuse the <math>y</math>-intercept and turning point as the zeros of the function.)</p> |

Expressions and Operations

**Topic**

Expressions and Operations

**Virginia SOL A.2**

The student will perform operations on polynomials, including

- a. applying the laws of exponents to perform operations on expressions;
- b. adding, subtracting, multiplying, and dividing polynomials; and
- c. factoring completely first- and second-degree binomials and trinomials in one or two variables.

Graphing calculators will be used as a tool for factoring and for confirming algebraic factorizations.

**Essential Questions and Understandings**

**Teacher Notes and Elaborations**

**Teacher Notes and Elaborations** *(continued)*

The apparent factors of  $f(x)$  are  $(x + 3)$  and  $(x + 5)$ .

Factor third-degree polynomials with at least one monomial as a factor such as:

$$3x^3 - 12x^2 + 9x$$

$$3x(x^2 - 4x + 3)$$

$$3x(x - 3)(x - 1)$$

Factor four terms by grouping such as:

$$ay + by + 3a + 3b$$

$$y(a + b) + 3(a + b)$$

$$(a + b)(y + 3)$$

Factor completely first and second degree polynomials with rational number coefficients.

$$\frac{1}{4}p^2 - 2p + 4$$

$$\frac{1}{9}n^2 - \frac{1}{25}$$

$$\frac{1}{4}(p^2 - 8p + 16)$$

$$\left(\frac{1}{3}n + \frac{1}{5}\right)\left(\frac{1}{3}n - \frac{1}{5}\right)$$

$$\frac{1}{4}(p - 4)^2$$

Whole numbers have both positive and negative roots. For example, the square root of 25 is 5 and <math>-5</math> (written as <math>\pm 5</math>), where 5 is the positive root and <math>-5</math> is the negative root.</p> <p>The non-negative square root of a number is called the <i>principal square root</i>. Most frequently used perfect squares must be committed to memory to allow for reasonable approximations of non-perfect squares.</p> <p>In Algebra I when finding the principal square root of an expression containing variables the result should not be negative. (All values for variables should be greater than zero.)</p> <p>A root of a number is a <i>radical</i> (e.g., <math>\sqrt{5}</math> is called a radical and 5 is the <i>radicand</i>).</p> <p>The square root of a whole number is in simplest form when the radicand has no perfect square factors other than one.</p> <p>The <i>cube root</i> of a number, <math>n</math>, is a number whose cube is that number. For example, the cube root of 125 is 5 (<math>\sqrt[3]{125} = 5</math>) because <math>5^3 = 125</math>. 125 is a perfect cube of 5. In general, <math>\sqrt[3]{n} = a</math> if <math>a^3 = n</math>. Sometimes the cube root is not a perfect cube. For example, the cube root of 16 is <math>2\sqrt[3]{2}</math> (<math>\sqrt[3]{16} = \sqrt[3]{2^3 \cdot 2} = 2\sqrt[3]{2}</math>).</p> <p style="text-align: right;">(continued)</p> |

For example: <math>x + 5 = 9</math> or <math>y = 3x - 8</math>.</p> <p>A <i>literal equation</i> is an equation that shows the relationship between two or more variables. Each variable in the equation "literally" represents an important part of the whole relationship expressed by the equation. To solve a literal equation means to rewrite the equation so a different variable stands alone on one side of the equal sign. That variable must be identified first. Given the literal equation <math>3x + 4y + 7z = 25 - 7z</math>, by applying rules of algebra it is possible to solve for each variable. A <i>formula</i> is a special type of literal equation. Experiences should include examples such as the following.</p> <div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <p>Example 1:</p> <math display="block">A = \frac{1}{2}(ah - bh) \text{ for } h</math> <math display="block">h = \frac{2A}{(a - b)}</math> <p>Note: An upper and lower case letter is used to represent two different numbers.</p> </div> <div style="width: 45%;"> <p>Example 2:</p> <math display="block">Q = 3a + 5ac \text{ for } a</math> <math display="block">a = \frac{Q}{(3 + 5c)}</math> <p>Note: <math>3a + 5ac</math> must be factored to isolate <math>a</math>.</p> </div> </div> <p>The application of solving literal equations will be used when writing equations of lines and solving systems of equations using substitution and elimination.</p> |

| <p><b><u>SOL Reporting Category</u></b><br/>Equations and Inequalities</p> <p><b><u>Topic</u></b><br/>Equations and Inequalities</p> <p><b><u>Virginia SOL A.4</u></b></p> | <p><b><u>Key Vocabulary</u></b><br/>           formula<br/>           infinite number of solutions<br/>           linear equation<br/>           literal equation<br/>           parabola<br/>           Properties of Equality: reflexive, symmetric, transitive, substitution, addition, subtraction, multiplication, and division<br/>           quadratic equation<br/>           real numbers<br/>           root(s)<br/>           set builder notation<br/>           solution set<br/>           standard form of a quadratic equation<br/>           system of equations<br/>           x-intercept<br/>           zeros of a function</p> | <p><b><u>Teacher Notes and Elaborations</u></b> <i>(continued)</i></p> <p>A solution to an equation is the value or set of values (<i>solution set</i>) that can be substituted to make the equation true. Experiences should include solving multi-step equations with fractions and variables on both sides of the equal sign. (e.g., <math>\frac{3}{4}(12x + 8) = \frac{2}{3}(6x + 9)</math>).</p> <p><i>Set builder notation</i> is used to represent solutions. For example, if the solution is <math>y = 10</math> then in set notation the answer is written <math>\{y : y = 10\}</math> or <math>\{y   y = 10\}</math>. If the solution has no elements, the solution is the empty set (null set) and the set notation is <math>\emptyset</math> or <math>\{\}</math>. An <i>element</i>, or member, of a set is any one of the distinct objects that make up that set.</p> <p>The <i>coefficient</i> is the numerical part of a term. A <i>constant</i> is a symbol representing a value that does not change. Coefficients and constants as rational numbers will be emphasized. Real-life situations involving literal equations (formulas) will be investigated and solved.</p> <p>The substitution property of equality (<i>substitution</i>) states that one name of a number can be substituted for another name of the same number in any expression. Substitution can be used if one statement is replaced with an equivalent one and <b>no</b> other property or definition works.</p> <p>In Grade 8 students identified the field properties of real numbers; and addition, subtraction, multiplication, division and substitution properties of equality to solve equations.</p> <p>Each step in the solution of the equation will be justified using the field properties of real numbers and the properties of equality. These properties may be modeled using manipulatives and pictorial representations.</p> <ul style="list-style-type: none"> <li>- <i>Properties of Equality</i>: reflexive, symmetric, transitive, substitution, addition, subtraction, multiplication, and division.</li> <li>- <i>Field Properties of Real Numbers</i>: closure, commutative, associative, inverse, identity, and distributive.</li> </ul> |

The nature of the inequality is not changed when adding or subtracting any real number or when multiplying or dividing by a positive real number. However, when multiplying or dividing by negative numbers you must reverse the inequality symbol to maintain a true statement. A solution to an inequality is the value or set of values, which can be substituted to make the inequality true. A multi-step inequality will involve the combination of two or more operations. Each step in the solution of the inequality will be justified using the axioms of inequality. An axiom is a statement universally recognized as true without proof.</p> <p>The <i>addition property of inequalities</i> states that if the same number is added to each side of a true inequality, the resulting inequality is also true.<br/>For any numbers <math>a</math>, <math>b</math>, and <math>c</math> the following are true,</p> <ol style="list-style-type: none"> <li>if <math>a &gt; b</math>, then <math>a + c &gt; b + c</math>.</li> <li>if <math>a &lt; b</math>, then <math>a + c &lt; b + c</math>.</li> </ol> <p>If <math>x - 2 &gt; 4</math>, then <math>x - 2 + 2 &gt; 4 + 2</math> and if <math>x - 2 &lt; 4</math>, then <math>x - 2 + 2 &lt; 4 + 2</math>.</p> <p>The <i>subtraction property of inequalities</i> states that if the same number is subtracted from each side of a true inequality, the resulting inequality is also true.<br/>For any numbers <math>a</math>, <math>b</math>, and <math>c</math> the following are true.</p> <ol style="list-style-type: none"> <li>if <math>a &gt; b</math>, then <math>a - c &gt; b - c</math>.</li> <li>if <math>a &lt; b</math>, then <math>a - c &lt; b - c</math>.</li> </ol> <p>If <math>x + 2 &gt; 4</math>, then <math>x + 2 - 2 &gt; 4 - 2</math> and if <math>x + 2 &lt; 4</math>, then <math>x + 2 - 2 &lt; 4 - 2</math>.</p> |

| <p><b><u>SOL Reporting Category</u></b><br/>Equations and Inequalities</p> <p><b><u>Topic</u></b><br/>Equations and Inequalities</p> <p><b><u>Virginia SOL A.5</u></b><br/>The student will solve multi-step linear inequalities in two variables, including</p> <ol style="list-style-type: none"> <li>solving multi-step linear inequalities algebraically and graphically;</li> <li>justifying steps used in solving inequalities, using axioms of inequality and properties of order that are valid for the set of real numbers and its subsets;</li> <li>solving real-world problems involving inequalities; and</li> <li>solving systems of inequalities.</li> </ol> | <p><i>Systems of inequalities</i> (simultaneous inequalities) are two or more inequalities in two or more variables that are considered together or simultaneously. The system may or may not have common solutions. Practical problems can be interpreted, represented, and solved using linear inequalities.</p> <p>The solution set of a system of linear inequalities can be determined by graphing each inequality in the same coordinate system. The overlapping region is the graph of the solution set.</p> <p><i>Set builder notation</i> is used to represent solutions. For example, if the solution is the set of all real numbers less than 5 then in set notation the answer is written <math>\{x : x &lt; 5\}</math> or <math>\{x x &lt; 5\}</math>. If the solution has no elements, the solution is the empty set (null set) and the set notation is <math>\emptyset</math> or <math>\{\}</math>. An element, or member, of a set is any one of the distinct objects that make up that set.</p> <p>Graphing can be used to demonstrate that both <math>x &lt; 5</math> and <math>5 &gt; x</math>, represent the same solution set. Examples should include solutions with variables on either side.</p> |

(Given two ordered pairs, the slope may be found by dividing the change in the y-coordinates by the change in the x-coordinates). The slope <math>m</math> of a line that passes through the points <math>(x_1, y_1)</math> and <math>(x_2, y_2)</math> is <math>m = \frac{y_2 - y_1}{x_2 - x_1}</math>. Students should understand that the subscripts are not interchangeable with exponents.</p> <p>The slope of a linear equation represents a constant rate of change in the dependent variable when the independent variable changes by a fixed amount.</p> <p>The slope of a line determines its relative steepness. Changing the relationship between the rise of the graph (change in the y-values) and the run (change in the x-values) affects the rate of change or “steepness” of a slope.</p> <p>The slope of a line can be determined in a variety of ways. Changes in slope affect the graph of a line. The slope intercept form of a linear equation is <math>y = mx + b</math> where <math>m</math> is the slope and <math>b</math> is the y-intercept. The slope of a line, <math>m</math>, is described as a “rate of change,” which may be positive, negative, zero, or undefined. A vertical line has an undefined slope and a horizontal line has a slope of zero.</p> <p>Emphasis should be placed on the difference between zero slope and undefined slope. The use of “no slope” instead of “zero slope” should be avoided because it is confusing to students.</p> <p>The graphing calculator is an effective tool to illustrate the effect of changes in the slope on the graph of the line.</p> <p>Slopes and y-intercepts are found in every day life where a relationship exists (e.g., motion, temperature, light variations, finance, etc.).</p> |

|--|---|
| <p><b>SOL Reporting Category</b><br/>Equations and Inequalities</p> <p><b>Topic</b><br/>Equations and Inequalities</p> <p><b>Virginia SOL A.6</b><br/>The student will graph linear equations and linear inequalities in two variables, including</p> <p>a. determining the slope of a line when given an equation of the line, the graph of the line, or two points on the line. Slope will be described as rate of change and will be positive, negative, zero, or undefined; and</p> <p>b. writing the equation of a line when given the graph of the line, two points on the line, or the slope and a point on the line.</p> | <p><b>Teacher Notes and Elaborations</b> <i>(continued)</i></p> <p>A line can be represented by its graph or by an equation. The equation of a line defines the relationship between two variables. The graph of a line represents the set of points that satisfies the equation of a line.</p> <p>Linear equations can be written in a variety of forms (Linear inequalities can also be written in a variety of forms.):</p> <ul style="list-style-type: none"> <li>- <i>Slope-intercept:</i> <math>y = mx + b</math>, where <math>m</math> is the slope and <math>b</math> is the <math>y</math>-intercept.</li> <li>- <i>Standard:</i> <math>Ax + By = C</math>, where <math>A</math>, <math>B</math>, and <math>C</math> are integers and <math>A</math> is positive.</li> <li>- <i>Point-slope:</i> <math>y - y_1 = m(x - x_1)</math></li> <li>- <i>Vertical line:</i> <math>x = a</math></li> <li>- <i>Horizontal line</i> (constant function): <math>y = b</math></li> </ul> <p>Equivalent equations have the same solution. For example <math>2x + y = 6</math> is equivalent to <math>4x + 2y = 12</math> and <math>y = -2x + 6</math>. Experiences should include writing and recognizing equivalent equations.</p> <p>The <i>parent function</i> for a linear equation is <math>y = x</math>.</p> <p>The <i>x-intercept</i> of the line is the value of <math>x</math> when <math>y = 0</math>. The <i>y-intercept</i> of the line is the value of <math>y</math> when <math>x = 0</math>.</p> <p>If the <math>x</math>- and <math>y</math>-intercepts are given, using these two points the equation of the line may be determined just as it is with any two points on the line. Also, given a point and the <math>x</math>- or <math>y</math>-intercept, the equation of the line can be determined.</p> <p>Equations of the line may be written using two ordered pairs (two points on the line), the <math>x</math>- and <math>y</math>-intercepts, or the slope and a point on the line.</p> <p>Using the slope and one of the coordinates, the equation may be written using the point-slope form of the equation, <math>y - y_1 = m(x - x_1)</math>.</p> <p>Justification of an appropriate technique for graphing linear equations and inequalities is dependent upon the application of slope, <math>x</math>- and <math>y</math>-intercepts, and graphing by transformations.</p> <p>Appropriate techniques for graphing linear equations and inequalities are determined by the given information and/or the tools available.</p> <p>The solution set for an inequality in two variables contains many ordered pairs when the domain and range are the set of real numbers. The graphs of all of these ordered pairs fill a region on the coordinate plane called a half-plane. An equation defines the boundary or edge for each half-plane.</p> <p>An appropriate technique for graphing a linear inequality is to graph the associated equation, determine whether the line is solid or broken, and then determine the shading by testing points in the region.</p> <p style="text-align: right;"><i>(continued)</i></p> |

Algebra is a tool for describing patterns, generalizing, and representing a relationship in which output is related to input. Mathematical relationships are readily seen in the translation of quantitative patterns and relations to equations or graphs. Collected data can be organized in a table or visualized in a graph and analyzed for patterns.</p> |

| Curriculum Information  | Essential Questions and Understandings<br>Teacher Notes and Elaborations   |
|---|--|
| <p><b><u>SOL Reporting Category</u></b><br/>Functions and Statistics</p> <p><b><u>Topic</u></b><br/>Functions</p> <p><b><u>Virginia SOL A.7</u></b></p> | <p><b><u>Teacher Notes and Elaborations</u></b> <i>(continued)</i></p> <p>Pattern recognition and analysis might include:</p> <ul style="list-style-type: none"> <li>- patterns involving a given sequence of numbers;</li> <li>- a set of ordered pairs from a given pattern;</li> <li>- a pattern using the variable(s) in an algebraic format so that a specific term can be determined;</li> <li>- patterns demonstrated geometrically on the coordinate plane when appropriate; and</li> <li>- patterns that include the use of the ellipsis such as 1, 2, 3 . . . 99, 100.</li> </ul> <p>Patterns may be represented as relations and/or functions. A <i>relation</i> can be represented by a set of ordered pairs of numbers or paired data values. In an ordered pair, the first number is termed the <i>abscissa</i> (<i>x</i>-coordinate) and the second number is the <i>ordinate</i> (<i>y</i>-coordinate).</p> <p>A <i>function</i> is a special relation in which each different input value is paired with exactly one output value (a unique output for each input). The set of input values forms the domain and the set of output values forms the range of the function. Sets of ordered pairs that do not represent a function should also be identified. Graphs of functions with similar features are called a <i>family of functions</i>.</p> <p>Graphs can be used as visual representations to investigate relationships between quantitative data. Students should have multiple experiences constructing linear and quadratic graphs utilizing <b>both</b> paper and pencil and the graphing calculator. Graphically, a function may be determined by applying the <i>vertical line test</i> (A graph is a function if there exists no vertical line that intersects the graph in more than one point.).</p> <p>If a sequence does not have a last term, it is called an infinite sequence. Three dots called an ellipsis are used to indicate an omission. If a sequence stops at a particular term, it is a finite sequence.</p> <p>Set builder notation is a method for identifying a set of values. For example, the domain for <math>y = x^2 - 5</math> would be written as <math>\{x : x \in \mathbb{R}\}</math>.</p> <p>This is read, "The set of all <math>x</math> such that <math>x</math> is an element of the real numbers." The range for this equation would be written as <math>\{y : y \geq -5\}</math>.</p> <p>To find the <i>y</i>-intercept in a quadratic function, let <math>x = 0</math>.</p> <p>In a function, the relationship between the domain and range may be represented by a rule. This rule may be expressed using <i>function notation</i>, <math>f(x)</math>, which means the value of the function at <math>x</math> and is read "<i>f</i> of <math>x</math>".</p> <p><i>Zeros of a function</i> (roots/solutions) are the <i>x</i>-intercepts of the function and are found algebraically by substituting 0 for <math>y</math> and solving the subsequent equation (e.g., If <math>f(x) = 2x + 4</math>, to find the zero solve <math>0 = 2x + 4</math>. The zero is <math>-2</math>, located at <math>(-2, 0)</math>). An object <math>x</math> in the domain of <math>f</math> is an <i>x</i>-intercept or a zero of a function <math>f</math> if and only if <math>f(x) = 0</math>.</p> <p>Domain, range, zeros and intercepts of a function can be presented algebraically and graphically. Experiences determining domain, range, zeros and intercepts should include a variety of graphs.</p> |

It is positive if the data value lies above the mean, and negative if the data value lies below the mean.</li> </ul> <p><b><u>Teacher Notes and Elaborations</u></b></p> <p>This objective is intended to extend the study of descriptive statistics beyond the measures of center studied during the middle grades. Although calculation is included in this objective, instruction and assessment emphasis should be on understanding and interpreting statistical values associated with a data set including standard deviation, mean absolute deviation, and z-score. While not explicitly included in this objective, the arithmetic mean will be integral to the study of descriptive statistics.</p> <p>The study of statistics includes gathering, displaying, analyzing, interpreting, and making predictions about a larger group of data (population) from a sample of those data. Data can be gathered through scientific experimentation, surveys, and/or observation of groups or phenomena. Numerical data gathered can be displayed numerically or graphically (examples would include line plots, histograms, and stem-and-leaf plots). Methods for organizing and summarizing data make up the branch of statistics called descriptive statistics.</p> <p style="text-align: right;"><i>(continued)</i></p> |

|--|---|
| <p><b>SOL Reporting Category</b><br/>Functions and Statistics</p> <p><b>Topic</b><br/>Statistics</p> <p><b>Virginia SOL A.9</b><br/>The student, given a set of data, will interpret variation in real-world contexts and calculate and interpret mean absolute deviation, standard deviation, and z-scores.</p> | <p><b>Teacher Notes and Elaborations</b> <i>(continued)</i></p> <p style="text-align: center;"><b>Sample vs. Population Data</b></p> <p>Sample data can be collected from a defined statistical population. Examples of a statistical population might include <i>SOL scores of all Algebra I students in Virginia, the heights of every U.S. president, or the ages of every mathematics teacher in Virginia</i>. Sample data can be analyzed to make inferences about the population. A data set, whether a sample or population, is comprised of individual data points referred to as elements of the data set.</p> <p style="background-color: #e0e0e0;">An element of a data set will be represented as <math>x_i</math>, where <math>i</math> represents the <math>i^{\text{th}}</math> term of the data set.*</p> <p>When beginning to teach this standard, start with small, defined population data sets of approximately 30 items or less to assist in focusing on development of understanding and interpretation of statistical values and how they are related to and affected by the elements of the data set.</p> <p>Related to the discussion of samples versus populations of data are discussions about notation and variable use. In formal statistics, the arithmetic <i>mean</i> (average) of a population is represented by the Greek letter <math>\mu</math> (mu), while the calculated arithmetic mean of a sample is represented by <math>\bar{x}</math>, read “x bar.” In general, a bar over any symbol or variable name in statistics denotes finding its mean.</p> <p style="background-color: #e0e0e0;">The arithmetic mean of a data set will be represented by <math>\mu</math>.*</p> <p>On both brands of approved graphing calculators in Virginia, the calculated arithmetic mean of a data set is represented by <math>\bar{x}</math>.</p> <p style="text-align: center;"><b>Mean Absolute Deviation vs. Variance and Standard Deviation</b></p> <p>Statisticians like to measure and analyze the <i>dispersion</i> (spread) of the data set about the mean in order to assist in making inferences about the population. One measure of spread would be to find the sum of the deviations between each element and the mean; however, this sum is always zero. There are two methods to overcome this mathematical dilemma: 1) take the absolute value of the deviations before finding the average or 2) square the deviations before finding the average. The mean absolute deviation uses the first method and the variance and standard deviation uses the second. If either of these measures is to be computed by hand, do not require students to use data sets of more than about 10 elements.</p> <p><b>NOTE: Students have not been introduced to summation notation prior to Algebra I.</b> An introductory lesson on how to interpret the notation will be necessary.</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="background-color: #e0e0e0; padding: 5px;">Examples of summation notation:</div> <div style="background-color: #e0e0e0; padding: 5px;"> <math display="block">\sum_{i=1}^5 i = 1 + 2 + 3 + 4 + 5</math> </div> <div style="background-color: #e0e0e0; padding: 5px;"> <math display="block">\sum_{i=1}^4 x_i = x_1 + x_2 + x_3 + x_4</math> *         </div> </div> |

| <p><b>SOL Reporting Category</b><br/>Functions and Statistics</p> <p><b>Topic</b><br/>Statistics</p> <p><b>Virginia SOL A.9</b><br/>The student, given a set of data, will interpret variation in real-world contexts and calculate and interpret mean absolute deviation, standard deviation, and z-scores.</p> | <p><b>Teacher Notes and Elaborations</b> <i>(continued)</i></p> <p style="text-align: center;"><b>Mean Absolute Deviation</b></p> <p>Mean absolute deviation is one measure of spread about the mean of a data set, as it is a way to address the dilemma of the sum of the deviations of elements from the mean being equal to zero. The <i>mean absolute deviation</i> is the arithmetic mean of the absolute values of the deviations of elements from the mean of a data set.</p> <div style="text-align: center; background-color: #f0f0f0; padding: 10px;"> <math display="block">\frac{\sum_{i=1}^n  x_i - \mu }{n}</math> </div> <p>Mean absolute deviation <math>\frac{\sum_{i=1}^n  x_i - \mu }{n}</math>, where <math>\mu</math> represents the mean of the data set, <math>n</math> represents the number of elements in the data set, and <math>x_i</math> represents the <math>i^{\text{th}}</math> element of the data set.*</p> <p>The mean absolute deviation is less affected by outlier data than the variance and standard deviation. Outliers are elements that fall at least 1.5 times the interquartile range (<i>IQR</i>) below the first quartile (<math>Q_1</math>) or above the third quartile (<math>Q_3</math>). Graphing calculators identify <math>Q_1</math> and <math>Q_3</math> in the list of computed 1-variable statistics. Mean absolute deviation cannot be directly computed on the graphing calculator as can the standard deviation. The mean absolute deviation must be computed by hand or by a series of keystrokes using computation with lists of data. More information (keystrokes and screenshots) on using graphing calculators to compute this can be found in the Sample Instructional Strategies and Activities.</p> <p style="text-align: center;"><b>Variance</b></p> <p>The second way to address the dilemma of the sum of the deviations of elements from the mean being equal to zero is to square the deviations prior to finding the arithmetic mean. The average of the squared deviations from the mean is known as the <i>variance</i>, and is another measure of the spread of the elements in a data set.</p> <div style="text-align: center; background-color: #f0f0f0; padding: 10px;"> <math display="block">\frac{\sum_{i=1}^n (x_i - \mu)^2}{n}</math> </div> <p>Variance <math>\frac{\sum_{i=1}^n (x_i - \mu)^2}{n}</math>, where <math>\mu</math> represents the mean of the data set, <math>n</math> represents the number of elements in the data set, and <math>x_i</math> represents the <math>i^{\text{th}}</math> element of the data set.*</p> <p>The differences between the elements and the arithmetic mean are squared so that the differences do not cancel each other out when finding the sum. When squaring the differences, the units of measure are squared and larger differences are “weighted” more heavily than smaller differences. In order to provide a measure of variation in terms of the original units of the data, the square root of the variance is taken, yielding the standard deviation.</p> <p style="text-align: right;"><i>(continued)</i></p> |

\*The shaded notation and formulas will be used on the Algebra I SOL assessment and included on the formula sheet for the Algebra EOC SOL.

| Curriculum Information   | Essential Questions and Understandings<br>Teacher Notes and Elaborations   |
|--|--|
| <p><b>SOL Reporting Category</b><br/>Functions and Statistics</p> <p><b>Topic</b><br/>Statistics</p> <p><b>Virginia SOL A.9</b><br/>The student, given a set of data, will interpret variation in real-world contexts and calculate and interpret mean absolute deviation, standard deviation, and z-scores.</p> | <p><b>Teacher Notes and Elaborations</b> <i>(continued)</i></p> <p style="text-align: center;"><b>Standard Deviation</b></p> <p>The <i>standard deviation</i> is the positive square root of the variance of the data set. The greater the value of the standard deviation, the more spread out the data are about the mean. The lesser (closer to 0) the value of the standard deviation, the closer the data are clustered about the mean.</p> <div style="text-align: center; background-color: #f0f0f0; padding: 10px; margin: 10px 0;"> <math display="block">(\sigma) = \sqrt{\frac{\sum_{i=1} (x_i - \mu)^2}{n}}</math> <p>Standard deviation <math>(\sigma) = \sqrt{\frac{\sum_{i=1} (x_i - \mu)^2}{n}}</math>, where <math>\mu</math> represents the mean of the data set, <math>n</math> represents the number of elements in the data set, and <math>x_i</math> represents the <math>i^{\text{th}}</math> element of the data set.*</p> </div> <p>Often, textbooks will use two distinct formulas for standard deviation. In these formulas, the Greek letter “<math>\sigma</math>”, written and read “sigma”, represents the standard deviation of a population, and “<math>s</math>” represents the sample standard deviation. The population standard deviation can be estimated by calculating the sample standard deviation. The formulas for sample and population standard deviation look very similar except that in the sample standard deviation formula, <math>n - 1</math> is used instead of <math>n</math> in the denominator. The reason for this is to account for the possibility of greater variability of data in the population than what is seen in the sample. When <math>n - 1</math> is used in the denominator, the result is a larger number. So, the calculated value of the sample standard deviation will be larger than the population standard deviation. As sample sizes get larger (<math>n</math> gets larger), the difference between the sample standard deviation and the population standard deviation gets smaller. The use of <math>n - 1</math> to calculate the sample standard deviation is known as Bessel’s correction. Use the formula for standard deviation with <math>n</math> in the denominator as noted in the shaded box above.</p> <p>When using Casio or Texas Instruments (TI) graphing calculators to compute the standard deviation for a data set, two computations for the standard deviation are given, one for a population (using <math>n</math> in the denominator) and one for a sample (using <math>n - 1</math> in the denominator). Students should be asked to use the computation of standard deviation for population data in instruction and assessments. On a Casio calculator, it is indicated with “<math>x\sigma n</math>” and on a TI graphing calculator as “<math>\sigma x</math>”. More information (keystrokes and screenshots) on using graphing calculators to compute this can be found in the Sample Instructional Strategies and Activities.</p> <p style="text-align: right;"><i>(continued)</i></p> |

|---|---|
| <p><b><u>SOL Reporting Category</u></b><br/>Functions and Statistics</p> <p><b><u>Topic</u></b><br/>Statistics</p> <p><b><u>Virginia SOL A.9</u></b><br/>The student, given a set of data, will interpret variation in real-world contexts and calculate and interpret mean absolute deviation, standard deviation, and z-scores.</p> | <p><b><u>Teacher Notes and Elaborations</u></b> <i>(continued)</i></p> <p style="text-align: center;"><b>z-Scores</b></p> <p>A <i>z-score</i>, also called a standard score, is a measure of position derived from the mean and standard deviation of the data set. In Algebra I, the z-score will be used to determine how many standard deviations an element is above or below the mean of the data set. It can also be used to determine the value of the element, given the z-score of an unknown element and the mean and standard deviation of a data set. The z-score has a positive value if the element lies above the mean and a negative value if the element lies below the mean. A z-score associated with an element of a data set is calculated by subtracting the mean of the data set from the element and dividing the result by the standard deviation of the data set.</p> <div style="background-color: #e0e0e0; padding: 10px; margin: 10px 0;"> <math display="block">z = \frac{x - \mu}{\sigma}</math> <p>z-score = <math>\frac{x - \mu}{\sigma}</math>, where x represents an element of the data set, <math>\mu</math> represents the mean of the data set, and <math>\sigma</math> represents the standard deviation of the data set.*</p> </div> <p>A z-score can be computed for any element of a data set; however, they are most useful in the analysis of data sets that are normally distributed. In Algebra II, z-scores will be used to determine the relative position of elements within a normally distributed data set, to compare two or more distinct data sets that are distributed normally, and to determine percentiles and probabilities associated with occurrence of data values within a normally distributed data set.</p> |

|  |  | $\Sigma = 1018$   |  |  |             |           |           |           |         |          |          |           |       |           |            |           |           |           |               |            |               |     |     |     |     |     |    |    |     |     |     |     |    |     |     |    |     |     |     |     |     |     |  |  |                 |

(continued)

| Value ( $x$ ) | Mean $\mu$ | $(x_i - \mu)^2$    |
|---------------|------------|--------------------|
| 129           | 290        | 25,921             |
| 325           | 290        | 1,225              |
| 97            | 290        | 37,249             |
| 259           | 290        | 961                |
| 360           | 290        | 4,900              |
| 694           | 290        | 163,216            |
| 166           | 290        | 15,376             |
|               |            | $\Sigma = 248,848$ |

The standard deviation = 
$$\sqrt{\frac{\sum_{i=1}^n (x_i - \mu)^2}{n}}$$

$$= \sqrt{\frac{248,848}{7}}$$

$$= \sqrt{35,550}$$

$$\approx 188.5$$

The z-score for the Monongahela River =  $\frac{\text{value} - \text{mean}}{\text{standard deviation}}$

$$= \frac{129 - 290}{188.5}$$

$$\approx -0.85$$

## Sample Instructional Strategies and Activities

*(continued)***Example 1: (Computation of descriptive statistics using graphing calculators)**

Maya's company produces a special product on 14 days only each year. Her job requires that she report on production at the end of the 14 days. She recorded the number of products produced each day (below) and decided to use descriptive statistics to report on product production.

Number of Products produced daily: 40, 30, 50, 30, 50, 60, 50, 50, 30, 40, 50, 40, 60, 50

**Texas Instruments (TI-84)****Enter the data into L1**

- From the home screen click on STAT.
- To enter data into lists choose option "1: Edit" or ENTER.
- In L1, enter each element of the data set. Enter the first element and press ENTER to move to the next line and continue until all the elements have been entered into L1.

| L1       | L2 | L3 | 1 |
|----------|----|----|---|
| 30       |    |    |   |
| 40       |    |    |   |
| 50       |    |    |   |
| 40       |    |    |   |
| 60       |    |    |   |
| 50       |    |    |   |
| 50       |    |    |   |
| 30       |    |    |   |
| 40       |    |    |   |
| 50       |    |    |   |
| 40       |    |    |   |
| 60       |    |    |   |
| 50       |    |    |   |
| L1(15) = |    |    |   |

**Calculate variance and standard deviation by computing 1-Variable Statistics for L1**

- Press STAT ►
- Choose option "1: 1-Var Stats" or ENTER
- Press ENTER to compute the 1-variable statistics (defaults to L1, enter list name after "1-Var Stats" if data are in another list).

|                        |
|------------------------|
| 1-Var Stats            |
| $\bar{x}=45$           |
| $\Sigma x=630$         |
| $\Sigma x^2=29700$     |
| $Sx=10.19049331$       |
| $\sigma x=9.819805061$ |
| ↓ $n=14$               |

$\bar{x}$  = arithmetic mean of the data set

$\Sigma x$  = sum of the  $x$  values

$\Sigma x^2$  = sum of the  $x^2$  values

$Sx$  = sample standard deviation

$\sigma x$  = population standard deviation

$n$  = number of data points (elements)

**NOTE: " $\sigma x$ " will represent the standard deviation ( $\sigma$ ). Squaring  $\sigma$  will yield the variance ( $\sigma^2$ ).**

## Sample Instructional Strategies and Activities

*(continued)***Compute the mean absolute deviation using the data in L1**

- From the home screen click on STAT.
- Choose option “1: Edit” or ENTER.
- Press  $\blacktriangleright$  to move to L2.
- Press  $\blacktriangle$  to highlight L2.
- Press ENTER (to get “L2 =” at the bottom of the screen) MATH  $\blacktriangleright$
- Choose option “1: abs (” or ENTER
- Press  $2^{\text{nd}}$  1 (to get “L1”) - VARS choose option “5: Statistics…” and then choose option “2:  $\bar{x}$  ”(to get “  $\bar{x}$  ” or type in value)
- Press ) ENTER (L2 will automatically fill with data)

| L1      | L2 | L3 | 2 |
|---------|----|----|---|
| 40      | 5  |    |   |
| 30      | 15 |    |   |
| 50      | 5  |    |   |
| 30      | 15 |    |   |
| 50      | 5  |    |   |
| 60      | 15 |    |   |
| 50      | 5  |    |   |
| L2(1)=5 |    |    |   |

L2 now contains the  $|x_i - \mu|$  part of the mean absolute deviation formula. In order to complete the calculation of the mean absolute deviation, find the arithmetic mean of L2 by calculating the 1-variable statistics of L2.

- Press STAT  $\blacktriangleright$
- Choose option “1: 1-Var Stats” or ENTER
- Press  $2^{\text{nd}}$  2 (to get “L2”) ENTER to compute the 1-variable statistics for L2.

|                        |
|------------------------|
| 1-Var Stats            |
| $\bar{x}=8.571428571$  |
| $\Sigma x=120$         |
| $\Sigma x^2=1350$      |
| $Sx=4.972451581$       |
| $\sigma x=4.791574237$ |
| $\downarrow n=14$      |

$\bar{x} = 8.571428571$  from the 1-variable statistics of L2 represents the mean absolute deviation of the original data set recorded in L1.

**Example 2 - Interpretation of descriptive statistics**

**What types of inferences can be made about the data set with the given information?**

- The standard deviation of data set 1 is less than the standard deviation of data set 2. That tells us that there was less variation (more consistency) in the number of people playing basketball during April 1 – 14 (data set 1).
- When comparing the variance of the two data sets, the difference between the two indicates that data set 2 has much more dispersion of data than data set 1.
- The standard deviation of data set 2 is almost twice the standard deviation of data set 1, indicating that the elements of data set 2 are more spread out with respect to the mean.
- Given a standard deviation and graphical representations of different data sets, the standard deviation could be matched to the appropriate graph by comparing the spread of data in each graph.
- When a data set contains clear outliers (the elements with values of 1 and 2 in data set 2), the outlying elements have a lesser effect on the calculation of the mean absolute deviation than on the standard deviation.

**How can z-scores be used to make inferences about data sets?**

A z-score can be calculated for a specific element's value within the set of data. The z-score for an element with value of 30 can be

$$z = \frac{30 - 45}{20.5} = -0.73$$

computed for data set 2.

The value of -0.73 indicates that the element falls just under one standard deviation below (negative) the mean of the data set. If the mean, standard deviation, and z-score are known, the value of the element associated with the z-score can be determined. For instance, given a standard deviation of 2.0 and a mean of 8.0, what would be the value of the element associated with a z-score of 1.5? Since the z-score is positive, the associated element lies above the mean. A z-score of 1.5 means that the element falls 1.5 standard deviations above the mean. So, the element falls  $1.5(2.0) = 3.0$  points above the mean of 8. Therefore, the z-score of 1.5 is associated with the element with a value of 11.0.

**Example 3 – Interpretation of descriptive statistics**

Maya represented the heights of boys in Mrs. Constantine's and Mr. Kluge's classes on a line plot and calculated the mean and standard deviation.

Mean = 68.4

Standard Deviation = 2.3

Note: In this problem, a small, defined population of the boys in Mrs. Constantine's and Mr. Kluge's classes is assumed.

How many elements are above the mean?

There are 9 elements above the mean value of 68.4.

How many elements are below the mean?

There are 12 elements below the mean value of 68.4.

How many elements fall within one standard deviation of the mean?

There are 12 elements that fall within one standard deviation of the mean. The values of the mean plus one standard deviation and the mean minus one standard deviation ( $\bar{x} - \sigma = 66.1$  and  $\bar{x} + \sigma = 70.7$ ) determine how many elements fall within one standard deviation of the mean. In other words, all 12 elements between  $\bar{x} - \sigma$  and  $\bar{x} + \sigma$  (boys that measure 67", 68", 69", or 70") are within one standard deviation of the mean.

**Application Scenarios**

1. Dianne oversees production of ball bearings with a diameter of 0.5 inches at three locations in the United States. She collects the standard deviation of a sample of ball bearings each month from each location to compare and monitor production.

| <b>Standard deviation of 0.5 inch diameter ball bearing production (in inches)</b> |             |               |                  |
|--|-------------|---------------|------------------|
|  | <b>July</b> | <b>August</b> | <b>September</b> |
| Plant location #1  | 0.01        | 0.01          | 0.02             |
| Plant location #2  | 0.02        | 0.04          | 0.05             |
| Plant location #3  | 0.02        | 0.01          | 0.01             |

Compare and contrast the standard deviations from each plant location, looking for trends or potential issues with production. What conclusions or questions might be raised from the statistical data provided? What other statistical information and/or other data might need to be gathered in order for Dianne to determine next steps?

*Sample response: Plant #1 and Plant #3 had standard deviations that seemed steady, but one would be wise to keep an eye on Plant #1 in the coming months, because it had increases in August and September. A potential concern with the standard deviation of Plant #2 exists. The growing standard deviation indicates that there might be an issue with growing variability in the size of the ball bearings. Plant #2 should be asked to take more frequent samples and continue to monitor, to check the calibration of the equipment, and/or to check for an equipment problem.*

2. Jim needs to purchase a large number of 20-watt fluorescent light bulbs for his company. He has narrowed his search to two companies offering the 20-watt bulbs for the same price. The Bulb Emporium and Lights-R-U claim that their 20-watt bulbs last for 10,000 hours. Which descriptive statistic might assist Jim in making the best purchase? Explain why it would assist him.

*Sample response: The standard deviation of the lifespan of each company's 20-watt bulbs should be compared. The bulbs with the lowest lifespan standard deviation will have the slightest variation in number of hours that the bulbs last. The bulbs with the slightest variation in the number of hours that they last means that they are more likely to last close to 10,000 hours.*

3. In a school district, Mr. Mills is in charge of SAT testing. In a meeting, the superintendent asks him how many students scored less than one standard deviation below the mean on the mathematics portion of the SAT in 2009. He looks through his papers and finds that the mean of the scores is 525 and 1653 students took the SAT in 2009. He also found a chart with percentages of z-scores on the SAT in 2009 as follows:

| z-score (mathematics) | Percent of students |
|-----------------------|---------------------|
| $z < -3$              | 0.1                 |
| $-3 \leq z < -2$      | 2.1                 |
| $-2 \leq z < -1$      | 13.6                |
| $-1 \leq z < 0$       | 34.0                |
| $0 \leq z < 1$        | 34.0                |
| $1 \leq z < 2$        | 13.6                |
| $2 \leq z < 3$        | 2.1                 |
| $z > 3$               | 0.1                 |

How can Mr. Mills determine the number of students that scored less than one standard deviation below the mean on the mathematics portion of the SAT?

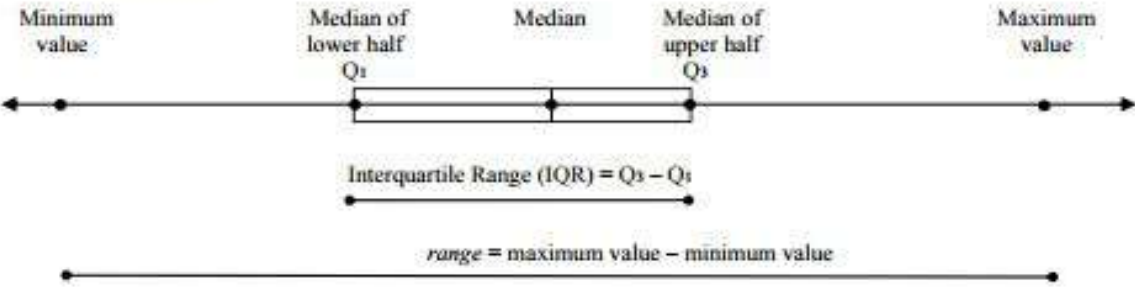

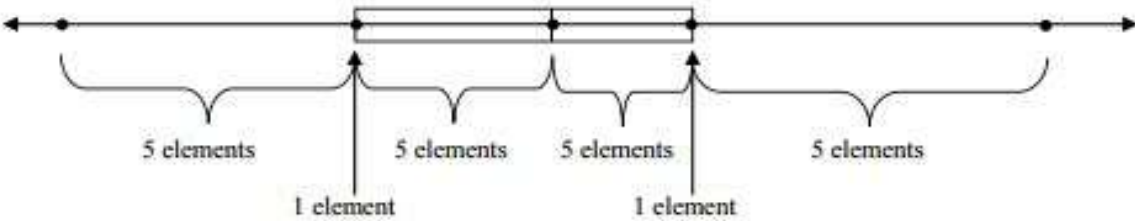

*Sample response: The z-score tells you how many standard deviations an element (in this case a score) is from the mean. If the z-score of a score is  $-1$ , then that score is 1 standard deviation below the mean. There are 15.8% ( $13.6\% + 2.1\% + 0.1\%$ ) of the scores that have a z-score  $< -1$ , so there are about 261 ( $0.158 \cdot 1653$ ) students that scored less than one standard deviation below the mean.*

**Questions to explore with students**

- Given a frequency graph, a standard deviation of \_\_\_\_\_, and a mean of \_\_\_\_\_, how many elements fall within \_\_\_\_\_ standard deviation(s) from the mean? Why?
- Given the standard deviation and mean or mean absolute deviation and mean, which frequency graph would most likely represent the situation and why?
- Given two data sets with the same mean and different spreads, which one would best match a data set with a standard deviation or mean absolute deviation of \_\_\_\_\_? How do you know?
- Given two frequency graphs, explain why one might have a larger standard deviation.
- Given a data set with a mean of \_\_\_\_\_, a standard deviation of \_\_\_\_\_, and a z-score of \_\_\_\_\_, what is the value of the element associated with the z-score?
- What do z-scores tell you about position of elements with respect to the mean? How do z-scores relate to their associated element's value?
- Given the standard deviation, the mean, and the value of an element of the data set, explain how you would find the associated z-score.

| Curriculum Information   | Essential Questions and Understandings<br>Teacher Notes and Elaborations  |
|--|---|
| <p><b>SOL Reporting Category</b><br/>Functions and Statistics</p> <p><b>Topic</b><br/>Statistics</p> <p><b>Virginia SOL A.10</b><br/>The student will compare and contrast multiple univariate data sets, using box-and-whisker plots.</p> | <p><b>Teacher Notes and Elaborations</b> (continued)</p> <p><i>Quartiles</i> partition an ordered collection into four quarters. The “whiskers” extend from the minimum to <math>Q_1</math> and <math>Q_3</math> to the maximum. The “box” extends from <math>Q_1</math> to <math>Q_3</math>.</p>  <p>The <i>interquartile range</i>, abbreviated IQR, is just the width of the box in the box-and-whisker plot. That is, <math>IQR = Q_3 - Q_1</math>. The IQR can be used as a measure of how spread-out the values are. Statistics assumes that values are clustered around some central value. The IQR tells how spread out the “middle” values are; it can also be used to tell when some of the other values are too far from the central value. These “too far away” points are called outliers, because they lie outside the expected range.</p> <p>In a real world example, given the total number of individual data points (elements) in a set, students determine how many elements are in each quartile. For example, given 22 elements both the upper half and lower half contain 11 elements each. Since the lower half contains 11 elements, the first quartile must contain 5 elements, 1 element lies on the median of the lower half, and the second quartile contains 5 elements. The same is true for the upper half; 5 elements in the third quartile, 1 element lies on the median of the upper half, and 5 elements in the fourth quartile.</p>  <p>A box-and-whisker plot makes it easy to see where the data are spread out and where they are concentrated. Experiences should include adding or removing a data point to determine how the original values change.</p> <p>Multiple box-and-whisker plots can be used to compare and contrast sets of data. Graphing calculators may be used to compare multiple box-and-whisker plots.</p> |

The solution must then refer to the original real-world situation.</li> <li>● Considerations such as sample size, randomness, and bias should affect experimental design.</li> </ul> <p><b><u>Teacher Notes and Elaborations</u></b></p> <p>When real-life data is collected, the data graphed usually does not form a perfectly straight line or a perfect quadratic curve. However, the graph may approximate a linear or quadratic relationship. A <i>curve of best fit</i> is a line that best represents the given data. The line may pass through some of the points, none of the points, or all of the points. When this is the case, a curve of best fit can be drawn, and a prediction equation that models the data can be determined. A curve of best fit for the relationship among a set of data points can be used to make predictions where appropriate. Accuracy of the equation can depend on sample size, randomness, and bias of the collection.</p> <p>The graphing calculator should be used to determine the equation of the curve of best fit for both linear and quadratic.</p> <p>A linear curve of best fit (line of best fit) may be determined by drawing a line and connecting any two data points that seem to best represent the data. An equal number of points should be located above and below the line. This line represents the equation to be used to make predictions.</p> <p>A quadratic curve of best fit may be determined by drawing a graph and connecting several points that seem to best represent the data. Entering these data points into a graphing calculator will result in a quadratic function. The graphing calculator allows for easy entry of larger data sets and therefore more accurate work. Different people may make different judgments for which points should be used, one person's equation may differ slightly from another's.</p> |
