

**Concept-Development
Practice Page****6-5*****Equilibrium on an Inclined Plane***

1. The block is at rest on a horizontal surface. The normal support force \mathbf{n} is equal and opposite to weight \mathbf{W} .
 - a. There is (friction) **(no friction)** because the block has no tendency to slide.

2. At rest on the incline, friction acts. Note (right) the resultant $\mathbf{f} + \mathbf{n}$ (dashed vector) is equal and opposite to \mathbf{W} .

- a. Here we see that the size of \mathbf{n} is **(less than)** (equal to) (greater than) the size of \mathbf{W} .

3. Draw the resultant $\mathbf{f} + \mathbf{n}$ for the block at rest on the steeper incline.

- a. The resultant magnitude of $\mathbf{f} + \mathbf{n}$ is (less than) **(equal to)** (greater than) the magnitude of \mathbf{W} .
- b. As the angle of the incline increases, the magnitude of vector \mathbf{n} **(decreases)** (stays the same) (increases).

4. The block remains at rest on the still steeper incline. Draw vectors for equilibrium.

- a. How does the resultant $\mathbf{f} + \mathbf{n}$ compare to \mathbf{W} ?
Same magnitude; opposite direction

- b. Suppose the angle is increased and the block slides down the incline at constant velocity. Then the net force on the block is **(zero)** (greater than zero). If the angle is increased even further, then acceleration **(occurs)** (doesn't occur).

5. Further steepness of the incline means (less) **(more)** acceleration down the plane. When the incline is vertical, acceleration is (less than g) **(g)** (more than g).

**CONCEPTUAL PHYSICS**

Force-Vector Diagrams

Label your forces as W , T , f , n , or R
(with appropriate subscripts as needed).

In each case, a rock is acted on by one or more forces. Draw an accurate vector diagram showing all forces acting on the rock, and no other forces. Use a ruler, and do it in pencil so you can correct mistakes. The first two are done as examples. Show by the parallelogram rule in 2 that the vector sum of $T_A + T_B$ is equal and opposite to W (that is, $T_A + T_B = -W$). Do the same for 3 and 4. Draw and label vectors for the weight and normal forces in 5 to 10, and for the appropriate forces in 11 and 12.

<p>1. Static</p>	<p>2. Static</p>	<p>3. Static</p>
<p>4. Static</p>	<p>5. Static</p>	<p>6. Sliding at constant speed without friction</p>
<p>7. Decelerating due to friction</p>	<p>8. Static (Friction prevents sliding)</p>	<p>9. Rock slides (No friction)</p>
<p>10. Static</p>	<p>11. Rock in free fall</p>	<p>12. Falling at terminal velocity</p>
