1. EXECUTIVE SUMMARY

Sloan Vazquez McAfee (SVM or SVM team) was commissioned to identify the waste compositions and characteristics at Incline, Sage, Stead and Telegraph transfer stations in Washoe County. The two-season solid waste composition and characterization analysis was conducted on residential, commercial, and self-haul volume delivered to Incline, Sage and Stead transfer stations and the construction and demolition (C&D) volume delivered to Telegraph landfill during the weeks of November 6 and November 13, 2017, and April 16 and April 23, 2018.

The sampling and analysis was conducted by the SVM team, a consulting firm focused exclusively on municipal solid waste planning and management services, specializing in waste characterizations, MRF project development and operational analysis, rate studies, financial feasibility studies, municipal contract analysis and residential and commercial collection operations. The firm's principals have over 60 years of wide ranging expertise and experience in municipal waste management and recycling, and have conducted numerous waste composition studies at sites located throughout the United States. SVM maintains a specialized, streamlined organization that provides solid waste and recycling advisory services to both public and private sector solid waste and recycling enterprises.

2. METHODOLOGY

On October 11, 2017, Joe Sloan met with Washoe County Senior Environmental Health Specialist, Luke Franklin, to discuss the logistics and methods for implementation of the field-sampling process. During the week of October 30, 2017, SVM contacted the managers of each of the selected sampling sites in order to coordinate preparation for the sample collection and sorting process. The challenges that typically accompany the waste composition process were preemptively addressed via the assistance and cooperation of Washoe County, State of Nevada, Waste Management, Inc, and Nevada Recycling & Salvage managers. The successful sampling process was facilitated by:

- Luke Franklin, Washoe County
- Patty Moen, Nevada Division of Environmental Protection (NDEP)
- Michael Ruffner, Nevada Division of Environmental Protection (NDEP)
- Amy Santos – Washoe County Health District (WCHD)
- Greg Martinelli, Regional Manager, WMI
- Jeff Mayfield, General Manager, Sage & Stead Transfer Stations, WMI
- Brett Hansen, General Manager, Incline Village Transfer Station, WMI
- Chris Bielser, Owner/Manager, Nevada Recycling and Salvage

The intent of the solid waste composition and characteristics analysis is to identify, quantify and characterize MSW material types received for disposal at the Washoe County transfer stations. The two-season study is required due to the major seasonal variabilities that occur during normal weather cycles. The samplings were conducted in fall 2017 and spring of 2018.

The final results of this study provide data that is representative of typical disposal in Washoe County. This report reflects the aggregate data generated during both seasons of sampling.

The methodology differentiates between four major categories of waste delivered to the transfer stations. The waste generation categories specifically identified and sampled as part of this composition and characterization study include residential, commercial, self-hauled waste, and industrial and C&D materials. To ensure that the data collected was representative of the MSW as a whole, the following assumptions were made about the type and delivery method of the waste to be sampled:

- Residential and Commercial MSW is typically delivered in route collection vehicles to the Incline, Sage and Stead transfer stations. Although residential and commercial collection trucks may often be distinguished by either front-load, rear-load, or side-load configuration, drivers of the randomly selected vehicles were questioned by SVM staff in order to confirm the source of the load.
- Self-Haul, or Public solid waste is typically hauled to the Incline, Sage and Stead transfer stations by residents or small businesses using cars, pick-up trucks, and small trailers that are unloaded by hand.
- C&D materials are typically collected in open-top drop-boxes, end-dump trailers, dump trucks, and dump trailers. These materials are most often delivered to the Telegraph transfer station by waste collection companies, debris-box providers, and small contractors.

A. Sampling Approach

All Washoe County residential and commercial waste samples were hand-sorted. All self-haul and industrial/C&D loads were visually characterized. The following table shows the number of samples characterized for each waste generation category during the two-season field-sampling process.

Table 1: Waste Generation Categories, Sample Numbers and Sort Type

Waste Generation Category	Sort Type	Incline	Sage	Stead	Telegraph	Total Samples
Residential MSW	Hand Sort	12	40	16	-	68
Commercial MSW	Hand Sort	12	56	12	-	80
Self-Haul	Visual Sort	16	58	20	-	94
Industrial/C&D	Visual Sort	-	-	-	80	80
TOTAL SAMPLES		40	154	48	80	322

Sample Cell Selection

To randomly select samples, each load was divided into a 16-cell grid as depicted below. A randomizer tool was used to assign a primary and alternative cell for sampling. The sample was taken from the randomly assigned cell for each selected load. When the load arrived, the vehicle was directed to the designated location. Once the load was dumped, the randomly selected cell was extracted from the load and separated for sorting.

Figure 1: Sixteen-Cell Grid

Note: Cells 12, 14, and 16 are below cells 4, 6 and 8, respectively.

The randomizer is an MS-Excel worksheet that uses a set of formulas to randomly select material for sorting. Each cell in the sixteen cell table was assigned a random number. The first two cells were assigned an integer value based on their rank with the other cells. The number assigned to the first cell was the cell to be sampled, unless that cell was inaccessible. If accessible, the second cell was sampled.

B. Material Categories

The materials identified, extracted, sorted and weighed were divided into designated categories for each sample in order to establish the composition, or the various types of material, as well as the characterization, which is the shape and size of those materials. The types of items included in each material category are described below.

Dry Recoverable Fiber All clean dry fiber, including cardboard (OCC), chip board (cereal/shoe box), office paper, junk mail, and shredded paper that is readily recoverable using current waste/recycling processing technology.

PET UBC's PET plastic (#1) used beverage containers

HDPE	All readily identifiable HDPE, including UBC's, five-gallon pails, laundry baskets, trash cans, toys, et al
Film Plastic	All film plastic from t-shirt bags to large garbage bags and painters' tarps
Mixed Plastics	All readily identifiable plastics except PET, HDPE, and Film
Glass	CRV and plate (window) glass
Aluminum UBC's	All aluminum beverage containers, primarily CRV
Mixed Ferrous	Tin cans, steel (pots, pans, construction material, shelving, etc.)
Mixed Non-Ferrous	Aluminum windows and doors, folding lawn chairs, stainless steel fixtures, brass hardware, copper pipe, et al
Inerts	Dirt, rock, sand, brick, tile, ceramic, concrete, et al
Hazardous Waste	Pesticide, insecticide, paint, solvents, oil, cleaning solutions, et al
E-waste	All items that operate via AC current or battery
Textiles	Clothing, bedding, carpet, towels, rags, et al
Organics	Yard/garden waste, food waste, clean wood, painted/treated wood, wet contaminated fiber, rubber
Wet Contaminated Fiber	Fiber that has been soiled and is not marketable as a post-consumer fiber grade, and fiber that would disintegrate during the mechanical sorting process (screens and/or air classification) making it non-recoverable with fiber products.
Fines	Materials that fall through the 2" lattice on the sort table. Depending upon the source of the sample, the fines may be heavy in organic and inert materials, or in glass shards and small fiber (shred). The organic/inert fines are produced from unprocessed MSW or from "dirty" MRF operations. The glass/fiber fines are produced from "clean", or single-stream recycling processing plants.
Other	These materials are not readily recoverable as any of the other commodity/products. They are generally represented by items that are comprised of more than one material and cannot be readily, economically separated and recovered.

C. Detailed Hand-Sort Protocol

A total of 68 samples of residential MSW and 80 samples of commercial MSW were hand-sorted. The step-by-step protocol for the hand sort is described below.

1. Conducted daily safety briefings, then reviewed methodology and sorting categories with the crew to ensure that all crewmembers understood the detailed material definitions before sampling began. The members of the crew were the same throughout the sampling process, and same crew members conducted the same activities during each day of the sampling. This consistency of team membership and assignment ensured reliability and uniformity of results throughout the process.
2. Obtained waste samples from the randomly selected cell, as identified by the Field Crew Manager. The samples consisted of approximately 150-200 pounds of waste that were removed and placed onto a 9' X 12' tarp. The larger items were recovered directly from the tarp and deposited into 30-gallon tubs. Once the larger materials were removed from the sample, the sorting table was moved into place and used for the recovery of smaller items and the allocation of fines.
3. Hand-sorted materials were placed into the prescribed categories. Sorting crew members specialized in specific material categories and placed the sorted materials into a designated plastic container while the Field Crew Manager monitored the sorting process to ensure proper classification. The Field Crew Manager verified the purity of each material classification as it was weighed, prior to recording data on the data sheet.
4. The composition weights were then recorded by the Field Crew Manager on the data sheet, depicted below as Figure 2. At the end of each day, the Field Crew Manager conducted a quality control review of the data recorded.

Figure 2: Data Form

		WEIGHT #1	WEIGHT #2	WEIGHT #3	WEIGHT #4	WEIGHT #5
DRY, RECOVERABLE FIBER						
PET						
HDPE						
FILM PLASTICS						
MIXED PLASTICS						
GLASS						
ALUMINUM UBC's						
MIXED FERROUS						
MIXED NON-FERROUS						
INERTS						
HAZARDOUS WASTE						
E-WASTE						
TEXTILES						
Organics	YARD WASTE					
	FOOD WASTE					
	CLEAN WOOD					
	TREATED/PAINTED WOOD					
	WET/CONTAMINATED FIBER					
	RUBBER PRODUCTS					
	ALLOCATED ORGANICS					
FINES						
OTHER						

Examples of materials identified as “Fines” as part of the field work conducted at Washoe County transfer stations included the following:

- organic materials, which were primarily yard and food waste
- inert materials, which were primarily rock, gravel, sand and dirt
- small shards of glass, and
- <2” fiber, which was primarily 3x5 card or Post-it® note sized and shredded paper.

The four types of material described above made up >95% of the identified fines. The remaining material identified as fines made up the remaining <5% included items such as ammunition, pens and pencils, medication bottles, batteries and bottle caps.

Material identified as “Other” during the Washoe County transfer station field work included the following items:

- Tar Roofing
- Window Blinds
- Cat Litter
- Tarps
- Sofa Bed
- Med Waste (Blue Bag)
- Mylar
- Polycoated fiber
- Auto Body Parts
- Auto Interior Parts
- Foam Mattresses
- Office Cubicle Dividers
- Upholstered Furniture
- Diapers
- Asphalt Shingles
- Vinyl Coated Felt
- Strollers
- Roof tile w/ grout and wire
- Office chairs
- Concrete filled tire
- Shoes
- Trophies
- Spools of Nylon rope
- Particle board cabinet w/vinyl & hardware
- Polycoated juice/food packaging
- Stucco w/ wire and tar paper
- Basketball goal

D. Detailed Visual Characterization Protocol

Visual waste characterization analysis was conducted for a combined total of 46 samples of Self-Haul waste at Incline, Sage and Stead transfer stations and 40 samples of Industrial/C&D waste at the Telegraph transfer station. The visual sampling method is summarized in the following steps:

1. The volume of each sample (cubic yards) was estimated by a trained observer/classifier.
2. Using available solid waste volume-to-weight conversion tables, as informed by practical experience, the volume of each observed/classified sample was converted to weight.
3. The major classes of material were identified and noted. An estimator walked entirely around the load and noted all identified major material classes in the load, including paper, plastic, glass, metal, E-waste, yard waste, organics, C&D, hazardous waste and special wastes.
4. The volume for each major class of material was estimated, beginning with the largest major material class presented by volume. The process was repeated for the next most common major material class, and so on until each material class had been estimated. Finally, the totals for this step were calculated to ensure that they totaled 100 percent.
5. The volume for each specific sub-category within each of the major material classes was then estimated and recorded.
6. The data was then reconciled on the sampling form using input verification rules set up on the computer system to ensure the percentages totaled 100 percent.

E. Data Analysis

Following the separation of each sample, all material was weighed and the weight was recorded on field forms and then entered into the database and reviewed for accuracy. Data input was checked twice by a two-person team for quality control to confirm that there were not any typos such as transposed numbers or misplaced decimal points. The equations used in these calculations are provided below.

Waste Sort Analytical Procedures

The waste characterization and quantity profiles for this study were developed through the following four main steps:

1. Converted volumetric estimates of material categories to weight (for industrial and self-haul characterization estimates).
2. Calculated the composition of all samples in the given sector, based on the sample weight.

Converting Volumes to Weights

The composition calculations relied on the availability of individual material weights for each sample. For industrial and self-haul samples, volume estimates were converted to weights using accepted waste density conversion factors. Using the volume-to-weight conversion factors and the volume estimates obtained during the characterization of visual samples, individual material weights were calculated using the following formula:

$$c = m \times s \times v \times d$$

where:

m = percentage estimate of the material, as a portion of the material class (e.g., the extent to which newspaper constitutes all of the paper in the sample)

s = percentage estimate of the material class, as a portion of all the material in the sample (e.g., the extent to which paper constitutes all of the material in the sample)

v = total volume of the sample (in cubic yards)

d = density conversion of the material (in pounds/cubic yard)

c = the total weight of the specific material in the sample

Each material weight was scaled so that the sum of all material weights equals the actual total sample weight (or net weight of the load).

Composition Calculations

The composition estimates represent the ratio of the material categories' weight to the total waste for each noted sector. They were derived by summing each material's weight across all of the selected records and dividing by the sum of the total weight of waste, as shown in the following equation:

$$r_j = \frac{\sum_i c_{if}}{\sum_i w_i}$$

where:

c = weight of a particular material

w = sum of all material weights

for $i = 1$ to n

where n = number of selected samples

for $j = 1$ to m

where m = number of material categories

Confidence Interval

The confidence interval for this estimate was derived in two steps. First, the variance around the estimate was calculated, accounting for the fact that the ratio includes two random variables (the material and the total sample weights). The variance of the ratio estimator equation follows:

$$\hat{V}_{rj} = \left(\frac{1}{n}\right) \cdot \left(\frac{1}{\bar{w}^2}\right) \cdot \left(\frac{\sum_i (c_{ij} - r_j w_i)^2}{n-1}\right)$$

where:

$$\bar{w} = \frac{\sum_i w_i}{n}$$

Second, precision levels at the 90% confidence interval were calculated for a material's mean as follows:

$$r_j \pm \left(t \cdot \sqrt{\hat{V}_{rj}}\right)$$

where:

t = the value of the t-statistic (1.645) corresponding to a 90% confidence level.

Weighted Averages

The overall County waste composition estimates was calculated by performing a weighted average across the five waste types. The weighted average for an overall composition estimate was performed as follows:

$$O_j = (p_1 * r_{j1}) + (p_2 * r_{j2}) + (p_3 * r_{j3}) + \dots$$

where:

p = the proportion of tonnage contributed by the noted sample group

r = ratio of material weight to total waste weight in the noted sample group for $j = 1$ to m

where: m = number of material categories

The variance of the weighted average is calculated

$$VarO_j = (p_1^2 * \widehat{V}_{r_{j_1}}) + (p_2^2 * \widehat{V}_{r_{j_2}}) + (p_3^2 * \widehat{V}_{r_{j_3}}) + \dots$$

F. Implementation Dates and Personnel

The two-season waste characterization work was conducted in November 2017 and April 2018. The SVM project team included a crew of six sorters, a loader operator, a field crew manager and a principal. The team was equipped with a sorting table, a work table, tarps, tubs, hand tools, a skid steer, a digital scale with a 2/10ths of one-pound increment, and personal protective equipment including high visibility vests, hard hats, dust masks, steel-toed boots, puncture resistant gloves and safety glasses. A storage box was secured at the site for placement of the equipment at end of each workday.

The sampling process was effectively facilitated by the cooperation and active support of the management and field personnel. Their participation was critical to the timely, successful completion of the field sorting process. Personnel included the following:

- **Joe Sloan – SVM Owner/Principal**
- **Cliff Feldman – SVM Senior Associate**
- **Patrick Bedrosian – SVM Foreman/Equipment Operator**

3. WASTE COMPOSITION AND CHARACTERIZATION RESULTS

Using the prescribed methodology and protocols, the two, seasonal waste composition and characterization studies was completed at the Washoe County transfer stations. The data are provided for each material category, presented in tables and pie charts, according to the designated generator (Residential, Commercial, Self-Haul and Industrial/C&D). Additionally, the data for each individual season are provided in Exhibit Two.

Figure 8: Telegraph Transfer Station, Construction & Demolition Debris, Spring & Fall Data Results

EXHIBIT ONE: PHOTOS

Pine Needles are a large component of the MSW stream during the Spring season.

Collected loose, or in large yard-bags, the needles are accepted free of charge at the Incline Village Transfer station.

Self-hauled materials at Incline Village include residential demolition jobs and garage clean-outs.

Waste Management Inc collection vehicles dump mixed-loads of commercial and multi-family MSW at the transfer station

Route collection vehicles, both residential and commercial, delivered loads that were heavy in organic materials. The black bags contained pine needles and food wastes.

Sage Transfer Station, near downtown Reno

Sample extracted from commercial collection truck deposited on sorting table.

The Sage Transfer Station receives a wide variety of self-hauled materials including inert loads (concrete), furniture, and green waste.

SVM staff separating municipal solid waste into pre-selected categories.

Material composition at the various transfer station varies widely. Here, an entire load is comprised of carpet and carpet padding.

All inbound loads, including residential, commercial and self-haul material contained an abundance of leaves, pine needles and prunings during the entire testing period.

Commercial load for sampling at Stead Transfer Station.

The composition of self-hauled load varies widely. One load was predominantly mattresses, while the next was leaves or wood.

The composition of Loads delivered to Nevada Recycling and Salvage (Telegraph) vary widely.

Dump trucks and 6 to 10 cubic yard dump-trailers are the primary delivery vehicles to the Telegraph Road C&D facility.

Wide varieties of materials are received at the Telegraph Facility, including drywall, mixed demolition loads, furniture, and even whole loads of car bumpers.
