1. Estimate the product first. Solve by using the standard algorithm. Use your estimate to check the reasonableness of the product.

2. When multiplying 1,729 times 308, Clayton got a product of 53,253. Without calculating, does his product seem reasonable? Explain your thinking.

$$\begin{array}{l}
 1729 \times 308 \\
 \approx 2000 \times 300 \\
 = 600,000
 \end{array}$$

Clayton's product does not seem reasonable since our estimation is around 600,000.

3. A publisher prints 1,912 copies of a book in each print run. If they print 305 runs, the manager wants to know about how many books will be printed. What's a reasonable estimate?

$$\begin{array}{l}
 1912 \times 305 \\
 \approx 2000 \times 300 \\
 = 600,000
 \end{array}$$

Around 600,000 copies.
