*Public Schools*

# Physical Science

Grade 8

## Science Curriculum Guide

*Dinwiddie County Public Schools provides each student the opportunity to become a productive citizen, engaging the entire community in the educational needs of our children.*

# Physical Science Curriculum Guide

- The DCPS Curriculum Guide contains key concepts and SOL numbers for each week. These skill areas must be cross referenced with the DOE Enhanced Scope and Sequence and DOE Curriculum Framework.
- Grade Level(s): 8
- Prerequisite: Science 6 and Life Science
- Course Description: Physical Science is a laboratory-oriented program that provides students with a foundation in the physical sciences. Laboratory investigations and activities are the primary means for developing problem-solving skills and for developing the major concepts and principles of the fields of science which make up the eighth-grade program. Students also develop experimental research and design skills in a problem area of their choice. Research and decision-making skills are further developed through the investigation of local or national issues and concerns that result from the interaction of science, technology, and society.

**Dinwiddie County Public Schools  
Science Curriculum**

<b>PS.1</b>	<b>Blueprint Categories</b>	<b>Grade 8 SOL</b>	<b>Number of Items</b>
<p>PS.1 The student will demonstrate an understanding of scientific reasoning, logic and the nature of science by planning and conducting investigations in which</p> <ul style="list-style-type: none"> <li>a) chemicals and equipment are used safely;</li> <li>b) length, mass, volume, density, temperature, weight, and force are accurately measured;</li> <li>c) conversions are made among metric units, applying appropriate prefixes;</li> <li>d) triple beam and electronic balances, thermometers, metric rulers, graduated cylinders, probeware, and spring scales are used to gather data;</li> <li>e) numbers are expressed in scientific notation where appropriate;</li> <li>f) independent and dependent variables, constants, controls, and repeated trials are identified;</li> <li>g) data tables showing the independent and dependent variables, derived quantities, and the number of trials are constructed and interpreted;</li> <li>h) data tables for descriptive statistics showing specific measures of central tendency, the range of the data set, and the number of repeated trials are constructed and interpreted;</li> <li>i) frequency distributions, scatterplots, line plots, and histograms are constructed and interpreted;</li> <li>j) valid conclusions are made after analyzing data;</li> <li>k) research methods are used to investigate practical problems and questions;</li> <li>l) experimental results are presented in appropriate written form;</li> <li>m) models and simulations are constructed and used to illustrate and explain phenomena; and</li> <li>n) current applications of physical science concepts are used.</li> </ul>	<b>Scientific Investigation</b>	<b>PS.1</b>	<b>10</b>
	<b>Prior Knowledge</b>		
	<p>LS.1 The student will demonstrate an understanding of scientific reasoning, logic, and the nature of science by planning and conducting investigations in which</p> <ul style="list-style-type: none"> <li>a) data are organized into tables showing repeated trials and means;</li> <li>b) a classification system is developed based on multiple attributes;</li> <li>c) triple beam and electronic balances, thermometers, metric rulers, graduated cylinders, and probeware are used to gather data;</li> <li>d) models and simulations are constructed and used to illustrate and explain phenomena;</li> <li>e) sources of experimental error are identified;</li> <li>f) dependent variables, independent variables, and constants are identified;</li> <li>g) variables are controlled to test hypotheses and trials are repeated;</li> <li>h) data are organized, communicated through graphical representation, interpreted, and used to make predictions;</li> <li>i) patterns are identified in data and are interpreted and evaluated; and</li> <li>j) current applications are used to reinforce life science concepts.</li> </ul>		

Understanding the Standard	Essential Knowledge, Skills, and Procedures
<p>The critical scientific concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> <li>• The nature of science refers to the foundational concepts that govern the way scientists formulate explanations about the natural world. The nature of science includes the following concepts of <ul style="list-style-type: none"> <li>a) the natural world is understandable;</li> <li>b) science is based on evidence - both observational and experimental;</li> <li>c) science is a blend of logic and innovation;</li> <li>d) scientific ideas are durable yet subject to change as new data are collected;</li> <li>e) science is a complex social endeavor; and</li> <li>f) scientists try to remain objective and engage in peer review to help avoid bias.</li> </ul> </li> <li>• Systematic investigations require standard measures and consistent and reliable tools. International System of Units (SI or metric) measures, recognized around the world, are a standard way to make measurements.</li> <li>• Systematic investigations require organized reporting of data. The way the data are displayed can make it easier to see important patterns, trends, and relationships. Frequency distributions, scatterplots, line plots, and histograms are powerful tools for displaying and interpreting data.</li> <li>• Investigation not only involves the careful application of systematic (scientific) methodology, but also includes the review and analysis of prior research related to the topic. Numerous sources of information are available from print and electronic sources, and the researcher needs to judge the authority and credibility of the sources.</li> <li>• To communicate the plan of an experiment accurately, the independent variable, dependent variable, and constants must be explicitly defined.</li> <li>• The number of repeated trials needs to be considered in the context of the investigation. Often “controls” are used to establish a standard for comparing the results of manipulating the independent variable. Controls receive no experimental treatment. Not all experiments have a control, however.</li> <li>• The analysis of data from a systematic investigation may provide the researcher with a basis to reach a reasonable conclusion. Conclusions should not go beyond the evidence that supports them. Additional scientific research may yield new information that affects previous conclusions.</li> <li>• Different kinds of problems and questions require differing approaches and research. Scientific methodology almost always begins with a question, is based on observation and evidence, and requires logic and reasoning. Not all systematic investigations are experimental.</li> </ul>	<p>In order to meet this standard, it is expected that students will</p> <ul style="list-style-type: none"> <li>• make connections between the components of the nature of science and their investigations and the greater body of scientific knowledge and research.</li> <li>• select appropriate equipment (probeware, triple beam balances, thermometers, metric rulers, graduated cylinders, electronic balances, or spring scales) and utilize correct techniques to measure length, mass, density, weight, volume, temperature, and force.</li> <li>• design a data table that includes space to organize all components of an investigation in a meaningful way, including levels of the independent variable, measured responses of the dependent variable, number of trials, and mathematical means.</li> <li>• record measurements, using the following metric (SI) units: liter, milliliter (cubic centimeters), meter, centimeter, millimeter, grams, degrees Celsius, and newtons.</li> <li>• recognize metric prefix units and make common metric conversions between the same base metric unit (for example, nanogram to milligram or kilometer to meter).</li> <li>• use a variety of graphical methods to display data; create an appropriate graph for a given set of data; and select the proper type of graph for a given set of data, identify and label the axes, and plot the data points.</li> <li>• gather, evaluate, and summarize information, using multiple and variable resources, and detect bias from a given source.</li> <li>• identify the key components of controlled experiments: hypotheses, independent and dependent variables, constants, controls, and repeated trials.</li> <li>• formulate conclusions that are supported by the gathered data.</li> <li>• apply the methodology of scientific inquiry: begin with a question, design an investigation, gather evidence, formulate an answer to the original question, communicate the investigative process and results, and realize this methodology does not always follow a prescribed sequence.</li> </ul>

<ul style="list-style-type: none"> <li>• It is important to communicate systematically the design and results of an investigation so that questions, procedures, tools, results, and conclusions can be understood and replicated.</li> <li>• Some useful applications of physical science concepts are in the area of materials science (e.g., metals, ceramics, and semiconductors).</li> <li>• Nanotechnology is the study of materials at the molecular (atomic) scale. Items at this scale are so small they are no longer visible with the naked eye. Nanotechnology has shown that the behavior and properties of some substances at the nanoscale (a nanometer is one-billionth of a meter) contradict how they behave and what their properties are at the visible scale.</li> <li>• New discoveries based on nanoscience investigations have allowed the production of superior new materials with improved properties (e.g., computers, cell phones).</li> </ul>	<ul style="list-style-type: none"> <li>• communicate in written form the following information about investigations: the purpose/problem of the investigation, procedures, materials, data and/or observations, graphs, and an interpretation of the results.</li> <li>• describe how creativity comes into play during various stages of scientific investigations.</li> <li>• use current technologies to model and simulate experimental conditions.</li> <li>• recognize examples of the use of nanotechnology and its applications.</li> </ul>

Science Curriculum**

<b>PS.3</b>	<b>Blueprint Categories</b>	<b>Grade 8 SOL</b>	<b>Number of Items</b>
PS.3The student will investigate and understand the modern and historical models of atomic structure. Key concepts include a) the contributions of Dalton, Thomson, Rutherford, and Bohr in understanding the atom; and b) the modern model of atomic structure.	<b>Force, Motion, Energy, Matter</b>	<b>PS.3</b>	<b>15</b>
	<b>Prior Knowledge</b>		

<b>Understanding the Standard</b>	<b>Essential Knowledge, Skills, and Procedures</b>
<p>The critical scientific concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> <li>• Many scientists have contributed to our understanding of atomic structure.</li> <li>• The atom is the basic building block of matter and consists of subatomic particles (proton, neutron, electron, and quark) that differ in their location, charge, and relative mass. Protons and neutrons are made up of smaller particles called quarks.</li> <li>• Size at the atomic level is measured on the nanoscale.</li> <li>• Scientists use models to help explain the structure of the atom. Their understanding of the structure of the atom continues to evolve. Two models commonly used are the Bohr and the “electron cloud” (Quantum Mechanics) models. The Bohr model does not depict the three-dimensional aspect of an atom, and it implies that electrons are in static orbits. The “electron cloud” model better represents our current understanding of the structure of the atom.</li> </ul>	<p>In order to meet this standard, it is expected that students will</p> <ul style="list-style-type: none"> <li>• describe the historical development of the concept of the atom and the contributions of Dalton, Thomson, Rutherford, Bohr and other scientists (Schrödinger).</li> <li>• differentiate among the three basic particles in the atom (proton, neutron, and electron) and their charges, relative masses, and locations.</li> <li>• compare the Bohr atomic model to the electron cloud model with respect to its ability to represent accurately the three-dimensional structure of the atom.</li> </ul>

<b>PS.4</b>	<b>Blueprint Categories</b>	<b>Grade 8 SOL</b>	<b>Number of Items</b>
PS.4The student will investigate and understand the organization and use of the periodic table of elements to obtain information. Key concepts include <ul style="list-style-type: none"> <li>a) symbols, atomic number, atomic mass, chemical families (groups), and periods;</li> <li>b) classification of elements as metals, metalloids, and nonmetals; and</li> <li>c) formation of compounds through ionic and covalent bonding.</li> </ul>	<b>Force, Motion, Energy, Matter</b>	<b>PS.4</b>	<b>15</b>
	<b>Prior Knowledge</b>		
	6.4The student will investigate and understand that all matter is made up of atoms. Key concepts include <ul style="list-style-type: none"> <li>a) atoms consist of particles, including electrons, protons, and neutrons;</li> <li>b) atoms of a particular element are alike but are different from atoms of other elements;</li> <li>c) elements may be represented by chemical symbols;</li> <li>d) two or more atoms interact to form new substances, which are held together by electrical forces (bonds);</li> <li>e) compounds may be represented by chemical formulas;</li> <li>f) chemical equations can be used to model chemical changes; and</li> <li>g) a limited number of elements comprise the largest portion of the solid Earth, living matter, the oceans, and the atmosphere.</li> </ul>		

<b>Understanding the Standard</b>	<b>Essential Knowledge, Skills, and Procedures</b>
<p>The critical scientific concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> <li>• There are more than 110 known elements. No element with an atomic number greater than 92 is found naturally in measurable quantities on Earth. The remaining elements are artificially produced in a laboratory setting. Elements combine in many ways to produce compounds that make up all other substances on Earth.</li> <li>• The periodic table of elements is a tool used to organize information about the elements. Each box in the periodic table contains information about the structure of an element.</li> <li>• An atom’s identity is directly related to the number of protons in its nucleus. This is the basis for</li> </ul>	<p>In order to meet this standard, it is expected that students will</p> <ul style="list-style-type: none"> <li>• use the periodic table to obtain the following information about the atom of an element:               <ul style="list-style-type: none"> <li>- symbol</li> <li>- atomic number</li> <li>- atomic mass</li> <li>- state of matter at room temperature</li> <li>- number of outer energy level (valence) electrons.</li> </ul> </li> </ul>

the arrangement of atoms on the periodic table of elements.

- The vertical columns in the table are called groups or families. The horizontal rows are called periods.
- Elements in the same column (family) of the periodic table contain the same number of electrons in their outer energy levels. This gives rise to their similar properties and is the basis of periodicity — the repetitive pattern of properties such as boiling point across periods on the table.
- The periodic table of elements is an arrangement of elements according to atomic number and properties. The information can be used to predict chemical reactivity. The boxes for all of the elements are arranged in increasing order of atomic number. The elements have an increasing nonmetallic character as one reads from left to right across the table. Along the stair-step line are the metalloids, which have properties of both metals and nonmetals.
- The nonmetals are located to the right of the stair-step line on the periodic table.
- Metals tend to lose electrons in chemical reactions, forming positive ions. Nonmetals tend to gain electrons in chemical reactions, forming negative ions.
- Gaining or losing electrons makes an atom an ion.
- Gaining or losing neutrons makes an atom an isotope. However, gaining or losing a proton makes an atom into a completely different element.
- Atoms react to form chemically stable substances that are held together by chemical bonds and are represented by chemical formulas. To become chemically stable, atoms gain, lose, or share electrons.
- Compounds are formed when elements react chemically. When a metallic element reacts with a nonmetallic element, their atoms gain and lose electrons respectively, forming ionic bonds. Generally, when two nonmetals react, atoms share electrons, forming covalent (molecular) bonds.

- describe the organization of the periodic table in terms of
  - atomic number
  - metals, metalloids, and nonmetals
  - groups/families vs. periods.
- recognize that an atom's identity is related to the number of protons in its nucleus.
- categorize a given element as metal, nonmetal, or metalloid.
- given a chemical formula of a compound, identify the elements and the number of atoms of each that comprise the compound.
- recognize that the number of electrons in the outermost energy level determines an element's chemical properties or chemical reactivity.
- describe the difference between ionic and covalent bonding.
- predict what kind of bond (ionic or covalent) will likely form when metals and nonmetals are chemically combined.

<b>PS. 2</b>	<b>Blueprint Categories</b>	<b>Grade 8 SOL</b>	<b>Number of Items</b>
<p>PS.2The student will investigate and understand the nature of matter. Key concepts include</p> <ul style="list-style-type: none"> <li>a) the particle theory of matter;</li> <li>b) elements, compounds, mixtures, acids, bases, and salts;</li> <li>c) solids, liquids, and gases;</li> <li>d) physical properties;</li> <li>e) chemical properties; and</li> <li>f) characteristics of types of matter based on physical and chemical properties.</li> </ul>	<b>Force, Motion, Energy, Matter</b>	<b>PS.2</b>	<b>15</b>
	<b>Prior Knowledge</b>		
	<p>6.4The student will investigate and understand that all matter is made up of atoms. Key concepts include</p> <ul style="list-style-type: none"> <li>h) atoms consist of particles, including electrons, protons, and neutrons;</li> <li>i) atoms of a particular element are alike but are different from atoms of other elements;</li> <li>j) elements may be represented by chemical symbols;</li> <li>k) two or more atoms interact to form new substances, which are held together by electrical forces (bonds);</li> <li>l) compounds may be represented by chemical formulas;</li> <li>m) chemical equations can be used to model chemical changes; and</li> <li>n) a limited number of elements comprise the largest portion of the solid Earth, living matter, the oceans, and the atmosphere.</li> </ul>		

<b>Understanding the Standard</b>	<b>Essential Knowledge, Skills, and Procedures</b>
<p>The critical scientific concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> <li>• Matter is anything that has mass and occupies space. All matter is made up of small particles called atoms. Matter can exist as a solid, a liquid, a gas, or plasma.</li> <li>• Matter can be classified as elements, compounds, and mixtures. The atoms of any element are alike but are different from atoms of other elements. Compounds consist of two or more elements that are chemically combined in a fixed ratio. Mixtures also consist of two or more substances, but the substances are not chemically combined.</li> <li>• Compounds can be classified in several ways, including:</li> </ul>	<p>In order to meet this standard, it is expected that students will</p> <ul style="list-style-type: none"> <li>• describe the particle theory of matter.</li> <li>• describe how to determine whether a substance is an element, compound, or mixture.</li> <li>• define compounds as inorganic or organic. (All organic compounds contain carbon).</li> <li>• describe what a salt is and explain how salts form.</li> </ul>

<ul style="list-style-type: none"> <li>- acids, bases, salts</li> <li>- inorganic and organic compounds.</li> </ul> <ul style="list-style-type: none"> <li>• Acids make up an important group of compounds that contain hydrogen ions. When acids dissolve in water, hydrogen ions (<math>H^+</math>) are released into the resulting solution. A base is a substance that releases hydroxide ions (<math>OH^-</math>) into solution. pH is a measure of the hydrogen ion concentration in a solution. The pH scale ranges from 0–14. Solutions with a pH lower than 7 are acidic; solutions with a pH greater than 7 are basic. A pH of 7 is neutral. When an acid reacts with a base, a salt is formed, along with water.</li> <li>• Matter can be described by its physical properties, which include shape, density, solubility, odor, melting point, boiling point, and color. Some physical properties, such as density, boiling point, and solubility, are characteristic of a specific substance and do not depend on the size of the sample. Characteristic properties can be used to identify unknown substances.</li> <li>• Equal volumes of different substances usually have different masses.</li> <li>• Matter can also be described by its chemical properties, which include acidity, basicity, combustibility, and reactivity. A chemical property indicates whether a substance can undergo a chemical change.</li> </ul>	<ul style="list-style-type: none"> <li>• describe the properties of solids, liquids, gases, and plasma.</li> <li>• distinguish between physical properties (i.e., shape, density, solubility, odor, melting point, boiling point, and color) and chemical properties (i.e., acidity, basicity, combustibility, and reactivity).</li> <li>• find the mass and volume of substances and calculate and compare their densities.</li> <li>• analyze the pH of a solution and classify it as acidic, basic, or neutral.</li> <li>• determine the identity of an unknown substance by comparing its properties to those of known substances.</li> <li>• design an investigation from a testable question related to physical and chemical properties of matter. The investigation may be a complete experimental design or may focus on systematic observation, description, measurement, and/or data collection and analysis. (Students should be able to use the inquiry skills represented in PS.1 and LS.1 to compose a clear hypothesis, create an organized data table, identify variables and constants, record data correctly, construct appropriate graphs, analyze data, and draw reasonable conclusions.)</li> </ul>

<p><b>Acid-</b> is a compound with a ph less than 7 and neutralizes</p> <p><b>Atomic number-</b> is the number found on the periodic table of elements that determines the number of protons</p> <p><b>Base-</b> is a compound with a ph higher than 7</p> <p><b>Chemical bond-</b> is the force of attraction that holds two atoms together.</p>	<p><a href="#">The Particle Theory of Matter</a></p> <p><a href="#">PS. 2 Google Documents</a></p>	<p><a href="#">Book Room List</a></p>

**Chemical symbol** -is a one or two letter representation of an element.

**Compound**- is a substance made up of two or more elements that are chemically joined.

**Covalent bond**- is a chemical bond formed when two atoms share electrons.

**Element**- is a pure substance that cannot be broken down into other substances by chemical or physical means.

**Matter**- is anything that has mass and takes up space. Mixture forms when two or more substances are combined such that each substance retains its own chemical identity

**Molecule**- is a neutral group of two or more atoms held together by covalent bonds.

**Nucleus** -is the center of an atom that is made up of protons and neutrons.

**Neutron** -is a small sub atomic particle in the nucleus of the atom, with no electrical charge.

**Particle Theory of Matter**- state that all **matter** consists of many, very small **particles** which are constantly moving or in a continual state of motion.

**Periodic table**- is an arrangement of the elements showing the repeating pattern of their properties.

**Proton**- is a small, positively charged, sub atomic particle that are found in the nucleus of an atom

**Salts** -are any chemical compound formed from the reaction of an acid with a base, with all or part of the hydrogen of the acid replaced by a metal or other cation

**Sub-atomic particle**- a particle smaller than an atom (i.e. neutron, proton)

<b>PS.5</b>	<b>Blueprint Categories</b>	<b>Grade 8 SOL</b>	<b>Number of Items</b>
PS.5 The student will investigate and understand changes in matter and the relationship of these changes to the Law of Conservation of Matter and Energy. Key concepts include a) physical changes; b) chemical changes; and c) nuclear reactions.	<b>Force, Motion, Energy, Matter</b>	<b>PS.5</b>	<b>15</b>
	<b>Prior Knowledge</b>		

<b>Understanding the Standard</b>	<b>Essential Knowledge, Skills, and Procedures</b>
<p>The critical scientific concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> <li>Matter can undergo physical and chemical changes. In physical changes, the chemical composition of the substances does not change. In chemical changes, different substances are formed. Chemical changes are often affected by the surface area/volume ratio of the materials involved in the change.</li> <li>The Law of Conservation of Matter (Mass) states that regardless of how substances within a closed system are changed, the total mass remains the same. The Law of Conservation of Energy states that energy cannot be created or destroyed but only changed from one form to another.</li> <li>A chemical equation represents the changes that take place in a chemical reaction. The chemical formulas of the reactants are written on the left, an arrow indicates a change to new substances, and the chemical formulas of the products are written on the right. Chemical reactions are classified into two broad types: ones in which energy is released (exothermic) and ones in which energy is absorbed (endothermic). (The study of synthesis, decomposition, and replacement reactions can be reserved for high school chemistry.)</li> </ul>	<p>In order to meet this standard, it is expected that students will</p> <ul style="list-style-type: none"> <li>compare and contrast physical, chemical, and nuclear changes.</li> <li>identify the reactants and products in a given chemical equation formula.</li> <li>design an investigation that illustrates physical and chemical changes.</li> <li>given chemical formulas, write and balance simple chemical equations.</li> <li>analyze experimental data to determine whether it supports the Law of Conservation of Mass.</li> <li>recognize that some types of chemical reactions require continuous input of energy (endothermic) and others release energy (exothermic).</li> <li>describe, in simple terms, the processes that release nuclear energy (i.e., nuclear fission and nuclear fusion). Create a simple diagram to</li> </ul>

<ul style="list-style-type: none"> <li>Another type of change occurs in nuclear reactions. Nuclear energy is the energy stored in the nucleus of an atom. This energy can be released by joining nuclei together (fusion) or by splitting nuclei (fission), resulting in the conversion of minute amounts of matter into energy. In nuclear reactions, a small amount of matter produces a large amount of energy. However, there are potential negative effects of using nuclear energy, including radioactive nuclear waste storage and disposal.</li> </ul>	<p>summarize and compare and contrast these two types of nuclear energy.</p> <ul style="list-style-type: none"> <li>evaluate the positive and negative effects of using nuclear energy.</li> </ul>

<b>PS.10</b>	<b>Blueprint Categories</b>	<b>Grade 8 SOL</b>	<b>Number of Items</b>
PS.10 The student will investigate and understand the scientific principles of work, force, and motion. Key concepts include a) speed, velocity, and acceleration; b) Newton’s laws of motion; c) work, force, mechanical advantage, efficiency, and power; and d) technological applications of work, force, and motion.	<b>Force, Motion, Energy, Matter</b>	<b>PS.10</b>	<b>15</b>
	<b>Prior Knowledge</b>		

<b>Understanding the Standard</b>	<b>Essential Knowledge, Skills, and Procedures</b>
<p>The critical scientific concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> <li>• Acceleration is the change in velocity per unit of time. An object moving with constant velocity has no acceleration. A decrease in velocity is negative acceleration or deceleration. A distance-time graph for acceleration is always a curve. Objects moving with circular motion are constantly accelerating because direction (and hence velocity) is constantly changing.</li> <li>• Newton’s three laws of motion describe the motion of all common objects.</li> <li>• Mass and weight are not equivalent. Mass is the amount of matter in a given substance. Weight is a measure of the force due to gravity acting on a mass. Weight is measured in newtons.</li> <li>• A force is a push or pull. Force is measured in newtons. Force can cause objects to move, stop moving, change speed, or change direction. Speed is the change in position of an object per unit of time. Velocity may have a positive or a negative value depending on the direction of the change in position, whereas speed always has a positive value and is nondirectional.</li> </ul>	<p>In order to meet this standard, it is expected that students will</p> <ul style="list-style-type: none"> <li>• make measurements to calculate the speed of a moving object.</li> <li>• apply the concepts of speed, velocity, and acceleration when describing motion.</li> <li>• differentiate between mass and weight.</li> <li>• identify situations that illustrate each Law of Motion.</li> <li>• explain how force, mass, and acceleration are related.</li> <li>• apply the concept of mechanical advantage to test and explain how a machine makes work easier.</li> <li>• make measurements to calculate the work done on an object.</li> </ul>

<ul style="list-style-type: none"> <li>• Work is done when an object is moved through a distance in the direction of the applied force.</li> <li>• A simple machine is a device that makes work easier. Simple machines have different purposes: to change the effort needed (mechanical advantage), to change the direction or distance through which the force is applied, to change the speed at which the resistance moves, or a combination of these. Due to friction, the work put into a machine is always greater than the work output. The ratio of work output to work input is called efficiency.</li> <li>• Mathematical formulas are used to calculate speed, force, work, and power.</li> </ul>	<ul style="list-style-type: none"> <li>• make measurements to calculate the power of an object.</li> <li>• solve basic problems given the following formulas:  Speed = distance/time (<math>s = d/t</math>)  Force = mass <math>\times</math> acceleration (<math>F = ma</math>)  Work = force <math>\times</math> distance (<math>W = Fd</math>)  Power = work/time (<math>P = W/t</math>).</li> <li>• explain how the concepts of work, force, and motion apply to everyday uses and current technologies.</li> </ul>
---	---

	<b>Prior Knowledge</b>		

<b>Understanding the Standard</b>	<b>Essential Knowledge, Skills, and Procedures</b>
<p>The critical scientific concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> <li>• Several factors affect how much electricity can flow through a system. Resistance is a property of matter that affects the flow of electricity. Some substances have more resistance than others.</li> <li>• Friction can cause electrons to be transferred from one object to another. These static electrical charges can build up on an object and be discharged slowly or rapidly. This is often called static electricity.</li> <li>• Electricity is related to magnetism. Magnetic fields can produce electrical current in conductors. Electricity can produce a magnetic field and cause iron and steel objects to act like magnets.</li> <li>• Electromagnets are temporary magnets that lose their magnetism when the electric current is removed. Both a motor and a generator have magnets (or electromagnets) and a coil of wire that creates another magnetic field.</li> <li>• A generator is a device that converts mechanical energy into electrical energy. Most of the electrical energy we use comes from generators. Electric motors convert electrical energy into mechanical energy that is used to do work. Examples of motors include those in many</li> </ul>	<p>In order to meet this standard, it is expected that students will</p> <ul style="list-style-type: none"> <li>• design an investigation to illustrate the effects of static electricity.</li> <li>• construct and compare series and parallel circuits.</li> <li>• create an electromagnet and explain how it works.</li> <li>• explain the relationship between a magnetic field and an electric current.</li> <li>• construct simple circuits to determine the relationship between voltage, resistance, and current.</li> <li>• compare and contrast generators and motors and how they function.</li> <li>• identify situations in everyday life in which motors and generators are used.</li> <li>• provide examples of materials that are good conductors,</li> </ul>

<p>household appliances, such as blenders and washing machines.</p> <ul style="list-style-type: none"> <li>• A conductor is a material that transfers an electric current well. An insulator is material that does not transfer an electric current. A semiconductor is in-between a conductor and an insulator.</li> <li>• The diode is a semiconductor device that acts like a one way valve to control the flow of electricity in electrical circuits. Solar cells are made of semiconductor diodes that produce direct current (DC) when visible light, infrared light (IR), or ultraviolet (UV) energy strikes them. Light emitting diodes (LED) emit visible light or infrared radiation when current passes through them. An example is the transmitter in an infrared TV remote or the lighting course behind the screen in an LED TV or notebook computer screen.</li> <li>• Transistors are semiconductor devices made from silicon, and other semiconductors. They are used to amplify electrical signals (in stereos, radios, etc.) or to act like a light switch turning the flow of electricity on and off.</li> </ul>	<p>semiconductors, and insulators.</p> <ul style="list-style-type: none"> <li>• identify current applications of semiconductors and their uses (e.g., diodes and transistors).</li> </ul>

<p><b>Static electricity</b>-The build up of electric charges on an object.</p> <p><b>Current electricity</b>-A constant flow of electrons.</p> <p>series circuit-A circuit in which all parts are connected in a single loop.</p> <p><b>Parallel circuit</b>-A circuit in which different loads are on separate branches.</p> <p><b>Magnetic field</b>-The region around a magnet in which magnetic forces can act.</p> <p><b>Electric current</b>-A continuous flow of electric charge</p> <p>motor-A device that changes electrical energy into kinetic energy.</p> <p><b>Generator</b>-A device that uses electromagnetic induction</p>	<p><a href="#">Electricity and Circuits</a></p> <p><a href="#">Electricity and Magnetism</a></p> <p><a href="#">PS. 11 Google Documents</a></p>	<p><a href="#">Book Room List</a></p>

to convert kinetic energy into electrical energy.

**Voltage**-The difference in energy per unit charge as a charge moves between two points in an electric circuit.

**Resistance**-The opposition to the flow of electric charge.

**Current**-A continuous flow of charge caused by the motion of electrons. The rate at which a charge passes a given point.

**Direct current**-Electric current in which the charges always flow in the same direction.

**Electromagnet**-A magnet that consists of a solenoid wrapped around an iron core.

**Conductor**-A material in which charges can move easily.

**Alternating current**-Electric current in which the charges continually switch from flowing in one direction to flowing in the reverse direction.

**Insulator**-A material in which charges cannot easily move.

## PS. 1 Overview

The skills described in standard PS.1 are intended to define the “investigate” component of all of the other Physical Science standards (PS.2 – PS.11). The intent of standard PS.1 is that students will continue to develop a range of inquiry skills and achieve proficiency with those skills in the context of the concepts developed in the Physical Science curriculum. **Standard PS.1 does not require a discrete unit on scientific investigation because the inquiry skills that make up the standard should be incorporated in all the other Physical Science standards.** It is also intended that by developing these skills, students will achieve greater understanding of scientific inquiry and the nature of science, as well as more fully grasp the content-related Standards of Learning concepts. Models, simulations, and current applications are used throughout the course in order to learn and reinforce science concepts.

Across the grade levels, kindergarten through high school, the skills in the first standards form a nearly continuous sequence. It is very important that the Physical Science teacher be familiar with the skills in the sequence leading up to standard PS.1 (LS.1, 6.1, 5.1, 4.1).

Curriculum Information	Essential Knowledge and Skills Key Vocabulary	Essential Questions and Understandings Teacher Notes and Elaborations

n) current applications of physical science concepts are used. **Foundational Standards**

4.1  
5.4  
6.1  
LS.1

purpose/problem of the investigation, procedures, materials, data and/or observations, graphs, and an interpretation of the results.

- describe how creativity comes into play during various stages of scientific investigations.
- use current technologies to model and simulate experimental conditions.
- recognize examples of the use of nanotechnology and its applications.

**Key Vocabulary**

- constant
- control
- dependent variable
- experiment hypothesis
- independent variable
- inference
- investigation
- meniscus
- observations
- nanotechnology
- prediction
- qualitative data
- quantitative data
- validity

## **PS. 2 Overview**

The concepts in PS.2 build upon several science standards from previous grades, including K.4, 1.3, 2.3, 3.3, 5.4, and 6.4. These standards introduce and develop basic ideas about the characteristics and structure of matter. In PS.2, the ideas and terminology continue to be expanded and treated in greater depth, including more mathematical application. It is intended that students will actively develop scientific investigation, reasoning, and logic skills, and the nature of science (PS.1) in the context of the key concepts presented in this standard.

Curriculum Information	Essential Knowledge and Skills Key Vocabulary	Essential Questions and Understandings Teacher Notes and Elaborations
<p><b>Unit</b> Characteristics and Structure of Matter</p> <p><b>SOL Reporting Category</b> Force, Motion, Energy, and Matter <b>Virginia SOL PS.2</b></p> <p>The student will investigate and understand the nature of matter. Key concepts include a) the particle theory of matter; b) elements, compounds, mixtures, acids, bases, and salts; c) solids, liquids, and gases; d) physical properties; e) chemical properties; and f) characteristics of types of matter based on physical and chemical properties.</p> <p><b>K.4 Foundational Standards</b></p> <p>The student will investigate and understand that the position, motion, and physical properties of an object can be described. 1.3</p>	<p>The student will</p> <ul style="list-style-type: none"> <li>• describe the particle theory of matter.</li> <li>• describe how to determine whether a substance is an element, compound, or mixture.</li> <li>• define compounds as inorganic or organic. (All organic compounds contain carbon).</li> <li>• describe what a salt is and explain how salts form.</li> <li>• describe the properties of solids, liquids, gases, and plasma.</li> <li>• distinguish between physical properties (i.e., shape, density, solubility, odor, melting point, boiling point, and color) and chemical properties (i.e., acidity, basicity, combustibility, and reactivity).</li> <li>• find the mass and volume of substances and calculate and compare their densities.</li> <li>• analyze the pH of a solution and classify it as acidic, basic, or neutral.</li> <li>• determine the identity of an unknown substance by comparing its properties to those of known substances.</li> <li>• design an investigation from a testable question related to physical and chemical properties of matter. The investigation may be a complete experimental design or may focus on systematic observation, description,</li> </ul>	<p><b>Essential Questions</b></p> <ul style="list-style-type: none"> <li>• Matter can be described by its physical properties, which include shape, density, solubility, odor, melting point, boiling point, and color. Some physical properties, such as density, boiling point, and solubility, are characteristic of a specific substance and do not depend on the size of the sample. Characteristic properties can be used to identify unknown substances.</li> <li>• Equal volumes of different substances usually have different masses.</li> <li>• Matter can also be described by its chemical properties, which include acidity, basicity, combustibility, and reactivity. A chemical property indicates whether a substance can undergo a chemical change.</li> </ul> <p><b>Teacher Notes and Elaborations</b></p> <p><b>Resources</b></p> <p><a href="#">NASA Website Solids, Liquids and Gases (Sun-Earth Connection see phases of matter-structure of an atom)</a></p> <p><a href="#">University of Colorado Interactive Simulations</a></p> <p><a href="#">UVA Physical Science Activities</a></p>

The student will investigate and understand how different common materials interact with water.

**Foundational Standards**

The student will investigate and understand basic properties of solids, liquids, and gases. 3.3 The student will investigate and understand that objects are made of materials that can be described by their physical properties. 5.4 The student will investigate and understand that matter is anything that has mass and takes up space; and occurs as a solid, liquid, or gas. 6.4 The student will investigate and understand that all matter is made up of atoms.

measurement, and/or data collection and analysis. (Students should be able to use the inquiry skills represented in PS.1 and LS.1 to compose a clear hypothesis, create an organized data table, identify variables and constants, record data correctly, construct appropriate graphs, analyze data, and draw reasonable conclusions.)

**Key Vocabulary**

- acid
- acidity
- atom
- base
- basicity
- buoyancy
- combustibility
- compound
- conductivity
- density
- ductile
- element
- hydrogen
- ions
- hydroxide
- ions
- inorganic
- matter
- malleability
- mixtures
- organic

**PS.3 Overview**

PS.3 builds upon science standards 3.3, 5.4, and 6.4, which introduce basic concepts and terminology related to the atom. PS.3 focuses more specifically on the basic structure of the atom and how models have been and are used to explain atomic structure. It is intended that students will actively develop scientific investigation, reasoning, and logic skills, and the nature of science (PS.1) in the context of the key concepts presented in this standard.

Key concepts include a) the contributions of Dalton, Thomson, Rutherford, and Bohr in understanding the atom; and b) the modern model of atomic structure.</p> <p><b>Foundational Standards</b></p> <p>3.3 The student will investigate and understand that objects are made of materials that can be described by their physical properties.</p> <p>5.4 The student will investigate and understand that matter is anything that has mass and takes up space; and</p>	<p>The student will</p> <ul style="list-style-type: none"> <li>• describe the historical development of the concept of the atom and the contributions of Dalton, Thomson, Rutherford, Bohr and other scientists (Schrödinger).</li> <li>• differentiate among the three basic particles in the atom (proton, neutron, and electron) and their charges, relative masses, and locations.</li> <li>• compare the Bohr atomic model to the electron cloud model with respect to its ability to represent accurately the three-dimensional structure of the atom.</li> </ul> <p style="text-align: center;"><b>Key Vocabulary</b></p> <ul style="list-style-type: none"> <li>● atom</li> <li>● electron</li> <li>● neutron</li> <li>● particle</li> <li>● proton</li> <li>● quark</li> </ul>	<p style="text-align: center;"><b>Essential Questions</b></p> <ul style="list-style-type: none"> <li>• What information can be obtained about an atom's properties from the periodic table?</li> <li>• What are some properties that can be related to position on the periodic table?</li> <li>• What are the three main classes of elements in the periodic table?</li> <li>• How does a chemical formula represent the composition of a compound?</li> <li>• How are covalent and ionic bonds similar and different?</li> <li>• There are more than 110 known elements. No element with an atomic number greater than 92 is found naturally in measurable quantities on Earth. The remaining elements are artificially produced in a laboratory setting. Elements combine in many ways to produce compounds that make up all other substances on Earth.</li> <li>• The periodic table of elements is a tool used to organize information about the elements. Each box in the periodic table contains information about the structure of an element.</li> <li>• An atom's identity is directly related to the number of protons in its nucleus. This is the basis for the arrangement of atoms on the periodic table of elements.</li> <li>• The vertical columns in the table are called groups or families. The horizontal rows are called periods.</li> <li>• Elements in the same column (family) of the periodic table contain the same number of electrons in their outer energy levels. This gives rise to their similar properties and is the</li> </ul>

occurs as a solid, liquid, or gas.

6.4

The student will investigate and understand that all matter is made up of atoms.

basis of periodicity — the repetitive pattern of properties such as boiling point across periods on the table.

- The periodic table of elements is an arrangement of elements according to atomic number and properties. The information can be used to predict chemical reactivity. The boxes for all of the elements are arranged in increasing order of atomic number. The elements have an increasing nonmetallic character as one reads from left to right across the table.

Heat is the transfer of thermal energy between substances of different temperature. As thermal energy is added, the temperature of a substance increases.</p> <p>• Temperature is a measure of the average kinetic energy of the molecules of a substance. Increased temperature means greater average kinetic energy of the molecules in the substance being measured, and most substances expand when heated. The temperature of absolute zero (<math>-273^{\circ}\text{C}/0\text{K}</math>) is the theoretical point at which molecular motion stops.</p> <p>• Atoms and molecules are perpetually in motion.</p> <p>• The transfer of thermal energy occurs in three ways: by conduction, by convection, and by radiation.</p> <p>• As thermal energy is added to or taken away from a system, the temperature does not always change. There is no change in temperature during a phase change (freezing, melting, condensing, evaporating, boiling, and vaporizing) as this energy is being used to make or break bonds between molecules.</p>

that matter is anything that has mass and takes up space; and occurs as a solid, liquid, or gas.
