

**AP Calculus – Free Response****Post Exam Set #1**

**Exam Problem #5.)** The rate at which a baby bird gains weight is proportional to the difference between its adult weight and its current weight. At time  $t = 0$ , when the bird is first weighed, its weight is 20 grams. If  $B(t)$  is the weight of the bird, in grams, at time  $t$  days after it is first weighed, then

$$\frac{dB}{dt} = \frac{1}{5}(100 - B)$$

Let  $y = B(t)$  be the solution to the differential equation above with initial condition  $B(0) = 20$ .

(a) Is the bird gaining weight faster when it weighs 40 grams or when it weighs 70 grams? Explain your reasoning.

(b) Find  $\frac{d^2B}{dt^2}$  in terms of  $B$ . Use  $\frac{d^2B}{dt^2}$  to explain why the graph of  $B$  cannot resemble the following graph.

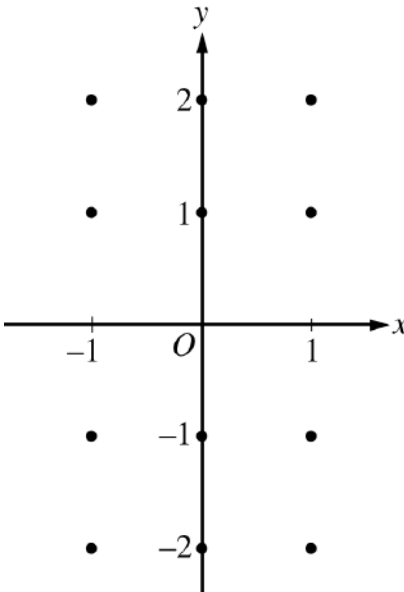

(c) Use separation of variables to find  $y = B(t)$ , the particular solution to the differential equation with initial condition  $B(0) = 20$ .

**Practice #1** Consider the differential equation  $\frac{dy}{dx} = e^y(3x^2 - 6x)$ . Let  $y = f(x)$  be the particular solution to the differential equation that passes through  $(1, 0)$ . (2013 AB6)

(a) Write an equation for the line tangent to the graph of  $f$  at the point  $(1, 0)$ . Use the tangent line to approximate  $f(1.2)$ .

(b) Find  $y = f(x)$ , the particular solution to the differential equation that passes through  $(1, 0)$

	<p><b>Practice #2</b> - Consider the differential equation <math>\frac{dy}{dx} = \frac{x+1}{y}</math>.</p> <p>(a) On the axes provided, sketch a slope field for the given differential equation at the twelve points indicated, and for <math>-1 &lt; x &lt; 1</math>, sketch the solution curve that passes through the point <math>(0, -1)</math>.</p> <p>(b) While the slope field in part (a) is drawn at only twelve points, it is defined at every point in the <math>xy</math>-plane for which <math>y \neq 0</math>. Describe all points in the <math>xy</math>-plane, <math>y \neq 0</math>, for which <math>\frac{dy}{dx} = -1</math>.</p> <p>(c) Find the particular solution <math>y = f(x)</math> to the given differential equation with the initial condition <math>f(0) = -2</math>.</p> <p>(2010 ABB5)</p>
<p><b>Practice #3</b> - Consider the differential equation <math>\frac{dy}{dx} = x^4(y-2)</math>.</p> <p>(a) On the axes provided, sketch a slope field for the given differential equation at the twelve points indicated.</p> <p>(b) While the slope field in part (a) is drawn at only twelve points, it is defined at every point in the <math>xy</math>-plane. Describe all points in the <math>xy</math>-plane for which the slopes are negative.</p> <p>(c) Find the particular solution <math>y = f(x)</math> to the given differential equation with the initial condition <math>f(0) = 0</math>.</p> <p>(2004 ABB5)</p>
