Unit 6: Data Analysis

EMPIRICAL RULE

What does a population that is normally distributed look like?

Empirical Rule

68-95-99.7% RULE

Empirical Rule

68-95-99.7% RULE

Empirical Rule

68-95-99.7% RULE

Empirical Rule—restated

- 68%** of the data values fall within **1** standard deviation of the mean in either direction
- 95%** of the data values fall within **2** standard deviation of the mean in either direction
- 99.7%** of the data values fall within **3** standard deviation of the mean in either direction

Remember values in a data set must appear to be a normal bell-shaped histogram, dotplot, or stemplot to use the Empirical Rule!

Average American adult male height is 69 inches (5' 9") tall with a standard deviation of 2.5 inches.

What does the normal distribution for this data look like?

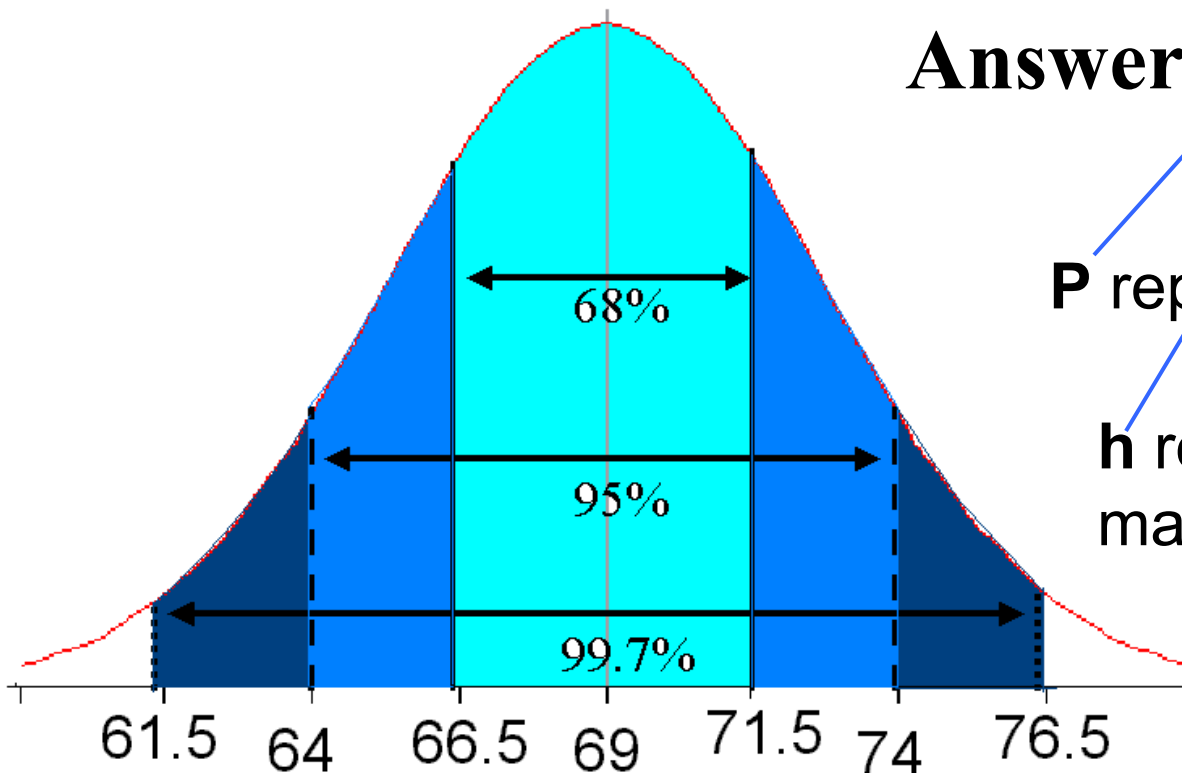

Empirical Rule-- Let $H \sim N(69, 2.5)$

What is the likelihood that a randomly selected adult male would have a height less than 69 inches?

Answer: $P(h < 69) = .50$

P represents **Probability**

h represents one adult male **height**

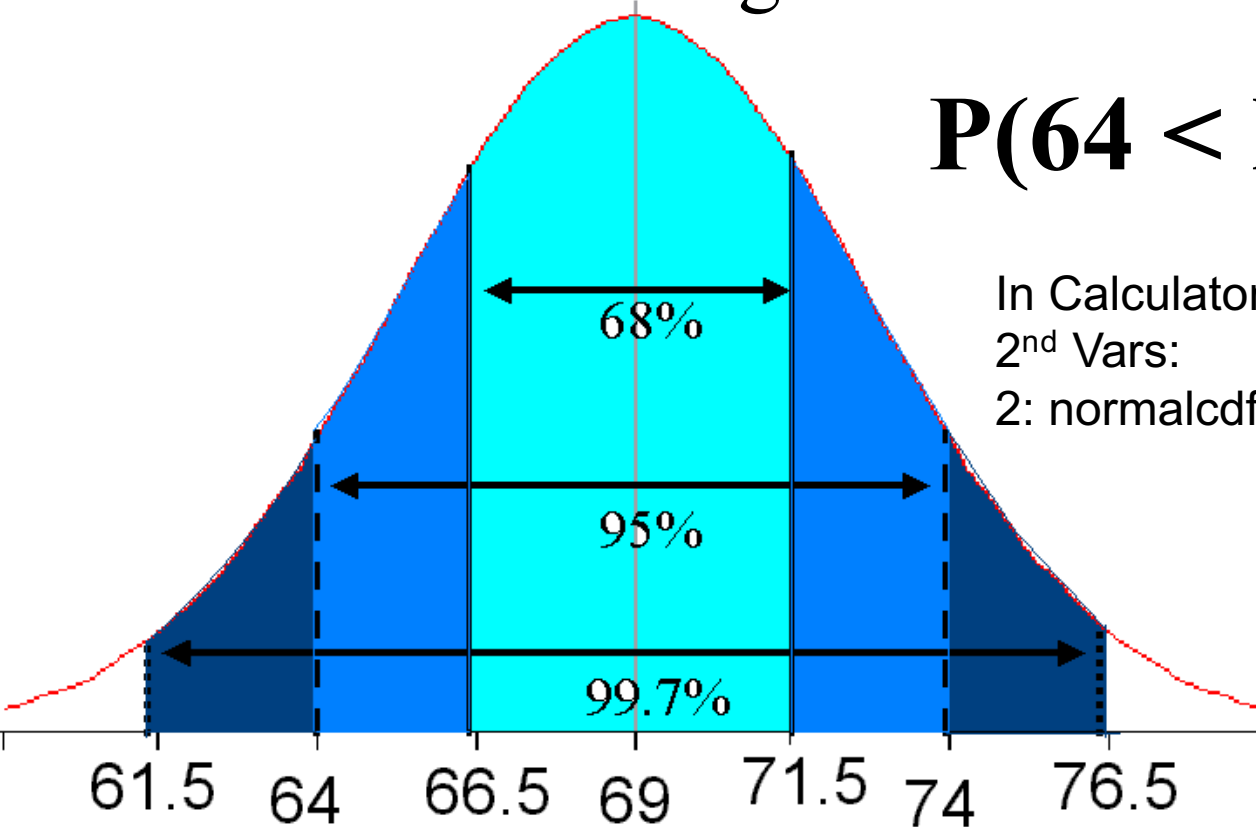

Using the Empirical Rule

Let $H \sim N(69, 2.5)$

What is the likelihood that a randomly selected adult male will have a height between 64 and 74 inches?

$$P(64 < h < 74) = .95$$

In Calculator:

2nd Vars:

2: normalcdf(lower, upper, mean, st. dev.)

Using Empirical Rule-- Let $H \sim N(69, 2.5)$

What is the likelihood that a randomly selected adult male would have a height of greater than 74 inches?

= .0228

Using Empirical Rule--Let $H \sim N(69, 2.5)$

What is the probability that a randomly selected adult male would have a height between 64 and 76.5 inches?

= .9759

Assignment: Statistics Test 1 Review
