**Annual Technical Report for
ACCESS for ELLs
Paper English Language Proficiency Test
Series 403, 2018–2019 Administration**

Annual Technical Report No. 15B

Prepared by:

Center for Applied Linguistics

Language Assessment Division
Psychometrics and Quantitative Research Team

April 2020

The WIDA ACCESS for ELLs Technical Advisory Committee

This report has been reviewed by the WIDA ACCESS for ELLs Technical Advisory Committee (TAC), which comprises the following members:

- Jamal Abedi, Ph.D., Professor, Graduate School of Education, University of California at Davis and a research partner at the National Center for Research on Evaluation, Standards, and Student Testing (CRESST)
- Lyle Bachman, Ph.D., Professor Emeritus, Applied Linguistics, University of California, Los Angeles
- Gregory J. Cizek, Ph.D., Guy B. Phillips Distinguished Professor, Educational Measurement and Evaluation, University of North Carolina at Chapel Hill
- Claudia Flowers, Ph.D., Professor, Educational Leadership, University of North Carolina at Charlotte
- Akihito Kamata, Ph.D., Professor, Department of Education Policy and Leadership, Department of Psychology, Southern Methodist University
- Timothy Kurtz, Hanover High School, Hanover, New Hampshire
- Carol Myford, Ph.D., Professor Emerita, Educational Psychology, University of Illinois at Chicago

Executive Summary

This is the 15th annual technical report on the ACCESS for ELLs English Language Proficiency Test and the fourth report since the assessment has been offered in both Paper and Online formats.

This technical report is produced as a service to members and potential members of the WIDA Consortium. The technical information herein is intended for use by those who have technical knowledge of test construction and measurement procedures, as stated in *Standards for Educational and Psychological Testing* (American Educational Research Association, American Psychological Association, & National Council on Measurement in Education, 2014).

ACCESS for ELLs is intended to assess reliably and validly the English language development of English language learners (ELLs) in Grades K–12 according to the WIDA 2012 Amplification of the English Language Development Standards Kindergarten–Grade 12 (WIDA Consortium, 2012). Results on ACCESS for ELLs are used by WIDA Consortium states for monitoring the progress of students, for making decisions about exiting students from language support services, and for accountability. WIDA additionally provides screening instruments for initial identification purposes; however, decision processes on how these are incorporated into identification decisions are at individual states' discretion.

ACCESS for ELLs assesses students in the four domains of Listening, Reading, Writing, and Speaking, as required by federal law (Elementary and Secondary Education Act of 1965, amended 2015; §1111(b)(1)(F); §1111(b)(2)(G)) and provides composite scores as required by the same statute (§3121).

ACCESS for ELLs Online Series 403 was administered in school year 2018–2019 in 35 states, the Bureau of Indian Education, the District of Columbia, the Commonwealth of the Northern Marianas, and the United States Virgin Islands, for a total of 39 state entities (henceforth “states”).

The Series 403 Paper data set included the results of 533,584 students. The largest grade was Kindergarten with 232,764 students, while the smallest was Grade 12 with 8,826 students. Of the participating WIDA states, the largest was Florida with 274,210 students, while the smallest was the Commonwealth of the Northern Marianas with 53 students.

ACCESS for ELLs Series 403 was offered in two administrative formats, an online format (Grades 1–12) and a paper format (Kindergarten–Grade 12). The current report (WIDA ACCESS Technical Report 15B) provides technical information pertaining to ACCESS for ELLs Series 403 Paper. A second report (WIDA ACCESS Technical Report 15A) provides technical information for the ACCESS for ELLs Series 403 Online assessment.

Part 1:
Purpose, Design, Implementation

Contents

1. Purpose and Design of ACCESS

1.1. Purpose	1-1
1.2. The WIDA Standards	1-1
1.3. The WIDA Proficiency Levels	1-2
1.4. Language Domains	1-4
1.5. Grade-Level Clusters	1-4
1.6. Tiers.....	1-5

2. Test Development

2.1. Test Design	2-1
2.1.1. Listening	2-1
2.1.2. Reading.....	2-1
2.1.3. Writing	2-2
2.1.4. Speaking	2-3
2.2. Test Development and Field Testing	2-4
2.2.1. Listening and Reading.....	2-5
2.2.2. Writing	2-6
2.2.3. Speaking	2-6
2.3. Item and Task Design.....	2-7
2.3.1. Listening Items	2-7
2.3.2. Reading Items	2-8
2.3.3. Writing Tasks	2-8
2.3.4. Speaking Tasks	2-9
2.4. Kindergarten	2-9

3. Assessment Performance: The Implementation of ACCESS

3.1. Test Delivery	3-1
3.2. Scoring Procedures	3-1
3.2.1. Listening and Reading.....	3-1
3.2.2. Writing	3-1
3.2.3. Speaking	3-5
3.3. Operational Administration	3-6
3.3.1. Listening Test Administration	3-6
3.3.2. Reading Test Administration.....	3-7
3.3.3. Writing Test Administration.....	3-7
3.3.4. Speaking Test Administration	3-8
3.3.5. Test Administrator Training	3-9
3.3.6. Test Security	3-9

3.4. Procedures for Including Students with Disabilities	3-10
3.4.1. Support Provided to All ELLs	3-10
3.4.2. Support Provided to ELLs with IEP or 504 Plans	3-11

4. Summary of Score Reports

4.1. Individual Student Report.....	4-1
4.2. Other Reports.....	4-3

1. Purpose and Design of ACCESS

1.1. Purpose

The overarching purpose of ACCESS for ELLs is to assess the developing English language proficiency of English language learners (ELLs) in Grades K–12 in the United States as defined by the multistate WIDA Consortium, first in the English Language Proficiency Standards (Gottlieb, 2004; WIDA Consortium, 2007) and then in the amplified 2012 English Language Development (ELD) Standards (WIDA Consortium, 2012). The WIDA ELD Standards, which correspond to the academic language identified in state academic content standards, describe six levels of developing English language proficiency and form the core of the WIDA Consortium’s approach to instructing and testing ELLs. ACCESS may thus be described as a standards-based English language proficiency test designed to measure the social and academic language proficiency of ELLs in English. It assesses social and instructional English as well as the academic language associated with language arts, mathematics, science, and social studies within the school context across the four language domains (Listening, Reading, Writing, and Speaking).

Other major purposes of ACCESS include

- Identifying the English language proficiency level of students with respect to the WIDA ELD Standards used in all member states of the WIDA Consortium
- Identifying students who have attained English language proficiency
- Assessing annual English language proficiency gains using a standards-based assessment instrument
- Providing districts with information that will help them to evaluate the effectiveness of their language instructional educational programs and determine staffing requirements
- Providing data for meeting federal and state statutory requirements with respect to student assessment
- Providing information that enhances instruction and learning in programs for English language learners

ACCESS for ELLs is offered in two formats: ACCESS Paper, described in this report, and ACCESS Online, described in a companion report.

1.2. The WIDA Standards

Five foundational WIDA ELD Standards inform the design, structure, and content of ACCESS for ELLs:

- *Standard 1:* ELLs communicate in English for **Social and Instructional** purposes within the school setting.
- *Standard 2:* ELLs communicate information, ideas, and concepts necessary for academic success in the content area of **Language Arts**.
- *Standard 3:* ELLs communicate information, ideas, and concepts necessary for academic success in the content area of **Mathematics**.
- *Standard 4:* ELLs communicate information, ideas, and concepts necessary for academic success in the content area of **Science**.
- *Standard 5:* ELLs communicate information, ideas, and concepts necessary for academic success in the content area of **Social Studies**.

For practical purposes, the five Standards are abbreviated as follows in this report:

- Social and Instructional Language: SIL
- Language of Language Arts: LoLA
- Language of Math: LoMA
- Language of Science: LoSC
- Language of Social Studies: LoSS

Every selected-response item and every performance-based task on ACCESS for ELLs targets at least one of these five Standards. In the case of some test items and tasks, the Standards are combined as follows:

- Integrated Social and Instructional Language (SIL), Language of Language Arts (LoLA), and Language of Social Studies (LoSS): IT
- Language of Math (LoMA) and Language of Science (LoSC): MS
- Language of Language Arts (LoLA) and Language of Social Studies (LoSS): LS

1.3. The WIDA Proficiency Levels

The WIDA ELD Standards describe the continuum of language development via five language proficiency levels (PLs) that are fully delineated in the WIDA ELD Standards document (WIDA Consortium, 2012), with scores indicating progression through each level. These levels are *Entering, Emerging, Developing, Expanding, and Bridging*. There is also a final stage known as *Reaching*, which is used to describe students who have progressed across the entire WIDA English language proficiency continuum; as such, scores do not indicate progression through this level. The proficiency levels are shown graphically in Figure 1.

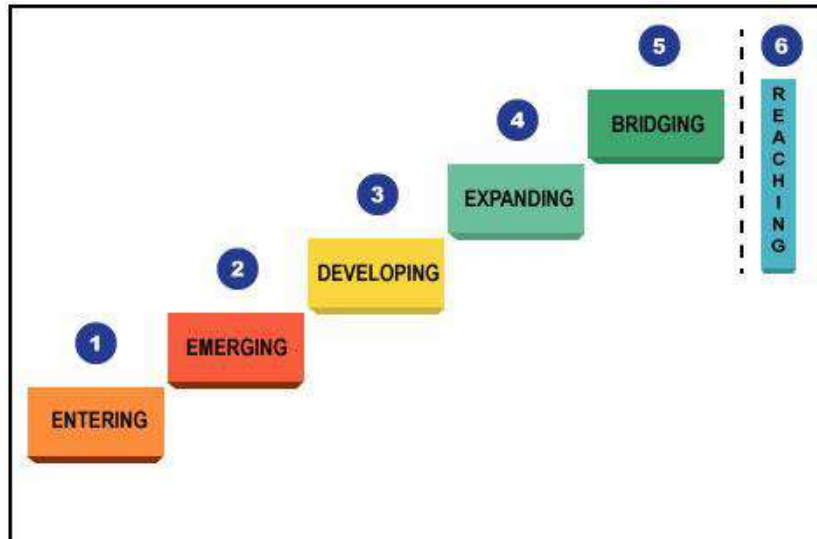

Figure 1. The language proficiency levels of the WIDA ELD Standards.

These language proficiency levels are embedded in the WIDA ELD Standards in a two-pronged fashion.

First, they appear in the **performance definitions**. According to the WIDA ELD Standards, the performance definitions provide a global overview of the stages of the language acquisition process. As such, they complement the **model performance indicators** (MPIs; see below) for each language proficiency level. The performance definitions are based on three criteria: (a) vocabulary usage at the word/phrase dimension; (b) language forms and conventions at the sentence dimension; and (c) linguistic complexity at the discourse dimension. Vocabulary usage refers to students’ increasing comprehension and production of the technical language required for success in the academic content areas. Language forms and conventions refers to the increasing development of phonological, syntactic, and semantic understanding in receptive skills or control of usage in productive language skills. Linguistic complexity refers to students’ demonstration of oral interaction or writing of increasing quantity and variety.

Second, the language proficiency levels of the WIDA ELD Standards are represented through connections to the accompanying MPIs, which exemplify the Standards. The MPIs describe the expectations for ELL students in each of the five Standards, by grade-level cluster, across the four language domains. That is, an MPI at each of the five language proficiency levels can be found within each combination of Standard, grade-level cluster, and language domain. *Reaching* (PL 6) represents the end of the continuum rather than another level of language proficiency. The sequence of these five MPIs together describes a logical progression and accumulation of skills on the path from the lowest level of English language proficiency to full English language proficiency for academic success. The grouping of five MPIs in logical progression is called a “strand.”

ACCESS for ELLs is based on individual MPIs organized into strands within the WIDA ELD Standards. Each selected-response item or performance-based task on ACCESS for ELLs is

carefully developed, reviewed, piloted, and field tested to ensure that it allows students to demonstrate accomplishment of the targeted MPI.

1.4. Language Domains

The WIDA ELD Standards describe developing English language proficiency for each of the four language domains: Listening, Reading, Writing, and Speaking. Thus, ACCESS for ELLs contains four sections, each assessing an individual language domain.

1.5. Grade-Level Clusters

The grade-level cluster structure for ACCESS for ELLs Paper is as follows: K, 1, 2, 3, 4–5, 6–8, 9–12.

In the lower grades (Grades 1–5), test forms may be shared across grade-level clusters. As described in Section 2.3.1. below, the Listening and Reading tests were developed prior to the launch of the 2016 operational administration, which represented the shift to the new cluster structure of Online ACCESS. Earlier ACCESS tests had a cluster structure that differs from that of the current ACCESS items in newer development, in the lower grades. The Speaking and Writing tests were developed using the ACCESS Online cluster structure. ACCESS Paper clusters, therefore, bridge the cluster structure of the older ACCESS assessments and ACCESS Online. For example, the Cluster 2 tests in the domains of Reading and Listening are the same test forms as the Cluster 1 tests. The Cluster 2 tests in the domains of Speaking and Writing are the same test forms as the Cluster 3 tests in these domains.

Table 1 details the grade-level cluster structure of ACCESS Paper and the shared forms across clusters.

Table 1
ACCESS Paper Grade-Level Clusters and Shared Forms Across Clusters

ACCESS Paper Grade-level Clusters	Shared Test Forms (Listening and Reading)	Shared Test Forms (Speaking and Writing)	Grade
K	K	K	K
1	Cluster 1 and Cluster 2	Cluster 1	1
2		Cluster 2 and Cluster 3	2
3	Cluster 3 and Cluster 4–5		Cluster 3
4–5		Cluster 4–5	4
			5
6–8	Cluster 6–8	Cluster 6–8	6
			7
			8
9–12	Cluster 9–12	Cluster 9–12	9
			10
			11
			12

Note that in our analyses of student participation in the assessment (Part 2 Chapter 1), analysis is conducted by cluster (K, 1, 2, 3, 4–5, 6–8, 9–12). In our analyses of test forms (Part 2 Chapter 2), analysis is conducted by test form (i.e., in Listening and Reading, a single analysis is conducted for the Cluster 1 and Cluster 2 form). These analyses are presented by cluster; if a table of results pertains to more than one cluster, it is repeated in each cluster.

1.6. Tiers

Tests must be at the appropriate difficulty level for individual test takers in order to be valid and reliable. While the grade-level cluster structure is a design feature intended to ensure that the language expectations are developmentally appropriate for children at different age ranges, it is also important to attend to students' differing levels of language proficiency within each grade-level cluster. As one might expect, test items and tasks that allow Entering (PL 1) or Emerging (PL 2) students to demonstrate accomplishment of the MPIs at their proficiency level will not allow Expanding (PL 4) or Bridging (PL 5) students to demonstrate the full extent of their language proficiency. Likewise, items and tasks that allow Expanding (PL 4) and Bridging (PL 5) students to demonstrate accomplishment of the MPIs at their level would be far too challenging for Entering (PL 1) or Emerging (PL 2) students. Items that are far too easy for test takers may be boring and lead to inattentiveness on the part of students; items that are far too difficult for test takers may be frustrating and discourage them from performing their best. But more importantly, items that are too easy or too hard for a student add very little to the accuracy or quality of the measurement of that student's language proficiency.

ACCESS is designed so that test forms are appropriate to the proficiency level of individual students across the wide range of proficiencies described in the WIDA ELD Standards. Test forms are constructed at either Tier A (for students at beginning levels of English proficiency), or Tier B/C (for students at higher proficiency levels). Each Grade 1–12 test taker takes either the Tier A form or the Tier B/C form. The Kindergarten assessment is not tiered.

In Listening and Reading, Tier A has items and tasks designed to allow students at the lowest language proficiency levels (PLs 1 and 2) to meet the WIDA ELD Standards at their language proficiency levels, and it includes some items targeted to PL 3. Tier B/C tests include items constructed to target Proficiency Levels 2 (Emerging) through 5 (Bridging).

In the domain of Writing, Tier A forms include tasks written to elicit language up to PL 3, and Tier B/C forms include tasks written to elicit language up to PL 4 or PL 5. In the domain of Speaking, students at early levels of proficiency take the Tier A form, with tasks designed to elicit language at PL1 and PL3; and more proficient students take the Tier B/C form, with tasks designed to elicit language at PL3 and PL5.

2. Test Development

2.1. Test Design

This section provides information on the tier structure of the two forms of Paper ACCESS (Tier A and Tier B/C) and the design of each form. Note that this section applies to ACCESS Paper Grades 1–12. For detail on Kindergarten, see Section 2.4 below and the technical report on the development of the Kindergarten static form (MacGregor et al., 2009).

2.1.1. Listening

In the domain of Listening, for each grade-level cluster, there are two test forms. Tier A forms have six folders of three items each, for a total of 18 items, and Tier B/C forms each have seven folders of three items each, for a total of 21 items. Figure 2 presents the Listening test design, showing the distribution of folders by Standard for each tier. In this figure, each small gray box represents an item. The items are grouped together in thematic folders of three items that assess the same Standard. Tier A items are targeted to Proficiency Levels 1–4, and Tier B/C items are targeted to Proficiency Levels 2–5.

Figure 2. Distribution of items by Standard for each tier of the Listening test.

2.1.2. Reading

In the domain of Reading, for each grade-level cluster, there are also two test forms, a Tier A form and a Tier B/C form. Tier A forms have eight folders of three items each, for a total of 24 items, and Tier B/C forms have nine folders of three items each, for a total of 27 items. Figure 3 presents the Reading test design, showing the distribution of folders by Standard for each tier. In this figure, each small gray box represents an item. The items are grouped together in thematic

folders of three items that assess the same standard. Tier A items are targeted to Proficiency Levels 1–4, and Tier B/C items are targeted to Proficiency Levels 2–5.

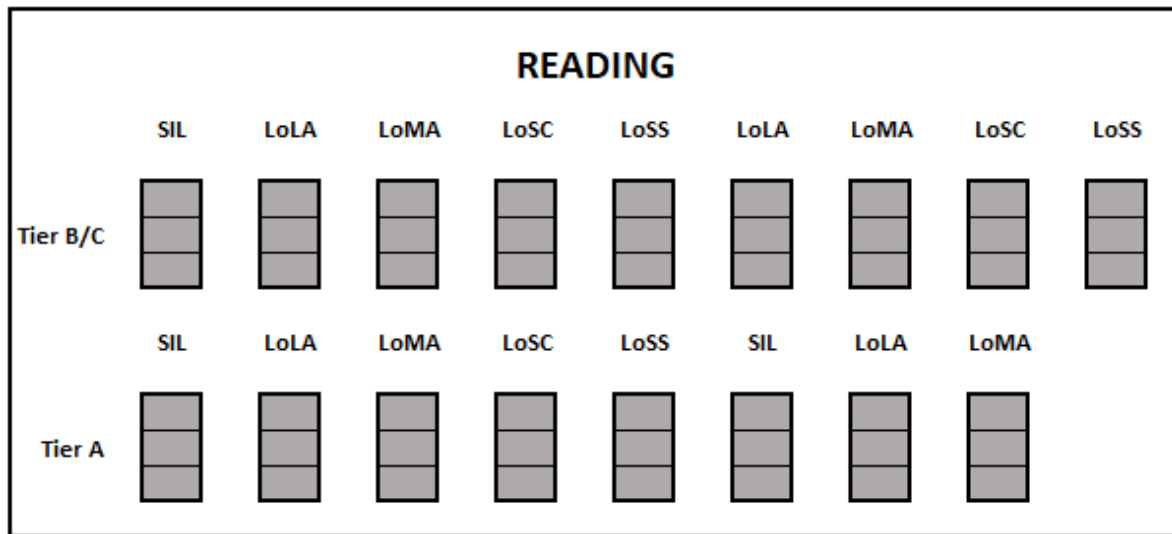

Figure 3. Distribution of items by Standard for each tier of the Reading test.

2.1.3. Writing

In the domain of Writing, for each grade-level cluster, there are two test forms. There is one test form for Tier A and one for Tier B/C. Tier A consists of tasks written to elicit language up to PLs 3, while Tier B/C is designed to elicit language up to PL 4 or 5. However, for both tiers of the test, all tasks are scored using the entire breadth of the scoring scale. Therefore, students can theoretically score anywhere from 0 to 9 on any task (in terms of the raw scores in the scoring scale), although the design of some tasks naturally limits the possible scores. For example, Tier A tasks are not designed to elicit extended responses, so although the tasks are scored using the entire scale, these tasks do not elicit language above PL 4. Likewise, although Tier B/C tasks are designed to elicit extended discourse so that students can display proficiency at PL 4, PL 5, or even PL 6, some students will score throughout the proficiency range. With the exception of Grade 1 Tier A, both tiers consist of three tasks. Grade 1 Tier A has four tasks. Figure 4 and Figure 5 present the Writing test design, showing the distribution of tasks for each tier. In these figures, each colored box represents a task. The number in the box represents the targeted proficiency level of the task.

Figure 4. Distribution of tasks by targeted proficiency level for each tier of the Grade 1 Writing test.

Figure 5. Distribution of tasks by targeted proficiency level for each tier of the Grades 2–12 Writing test.

2.1.4. Speaking

In the domain of Speaking, for each grade-level cluster, there are two test forms: one for Tier A and one for Tier B/C. All speaking tasks are constructed-response tasks. Tier A includes tasks that target language elicitation at PLs 1 and 3. Tier B/C includes tasks that target language elicitation at PLs 3 and 5. Each test form consists of three thematic folders, each with two tasks, for a total of six tasks. Figure 6 shows the structure of the Speaking test.

Figure 6. Distribution of tasks for each tier of the Speaking test.

2.2. Test Development and Field Testing

Development of ACCESS Series 400 Paper marked the transition point from the original ACCESS testing program, which was entirely paper based, to the launch of ACCESS in both Online and Paper formats. Development for ACCESS Series 403 Paper continues to reflect this transition. The Listening and Reading items for ACCESS Series 403 Paper were developed prior to the launch of ACCESS Online, when ACCESS was entirely paper based. Most Writing tasks were developed for ACCESS when it was entirely paper based; however, a small subset of Writing tasks on ACCESS Series 403 Paper were developed as online tasks that were subsequently laid out for administration as paper-based tasks. The Speaking tasks were developed and field tested as online tasks before being laid out for administration as paper tasks. The general process of item writing and editing, and of item content, bias, and sensitivity reviews, remains similar across these transitions. Trained item writers work from item specifications to draft items within a thematic folder. After initial development, folders are screened at CAL, and those that are approved for further development undergo a rigorous process of internal development and review, including reviews by standards experts and extensive fact checking. During this phase, images and other ancillary materials, such as scripts and directions, are produced.

After items are internally refined, they are reviewed by two panels: a content review panel and a bias and sensitivity review panel. The panels consist of specially trained educators with culturally and linguistically diverse backgrounds from WIDA Consortium states. Items are submitted to the content review panel to ensure that the content is accessible and relevant to students in the targeted grade-level cluster and at the targeted proficiency level and that each item or task matches the MPI from the WIDA ELD Standards that it is intended to assess. The bias and sensitivity review panel ensures that test items are free of material that (1) might favor any subgroup of students over another on the basis on gender, race/ethnicity, home language, religion, culture, region, or socioeconomic status, and (2) might be upsetting to students. Bias

and sensitivity panelists are educators with culturally and linguistically diverse backgrounds who have experience interacting with English learners from a range of cultural, regional, religious, linguistic, ethnic, and socioeconomic backgrounds. Based on their recommendations, the items are revised as necessary.

Note that this section applies to ACCESS Paper Grades 1–12. For detail on Kindergarten, see Section 2.4 below and the technical report on the development of the Kindergarten static form (MacGregor et al., 2009).

2.2.1. Listening and Reading

The Listening and Reading items for ACCESS Series 403 Paper were created prior to the launch of ACCESS Online Series 400 and were created when ACCESS was entirely paper based. ACCESS was first field tested in 2004, and from 2004 to 2014, development continued for ACCESS, culminating in Series 303, operational in 2014–2015. For further detail on this original field test and on the processes for ongoing item development from 2004 to 2014, see the ACCESS for ELLs Technical Reports, particularly ACCESS for ELLs Technical Report No. 1, *Development and Field Test of ACCESS for ELLs* (Kenyon, 2006) and *Annual Technical Report for ACCESS for ELLs® English Language Proficiency Test, Series 303* (Center for Applied Linguistics, 2016).

In all grade clusters, the Tier A Listening and Reading forms are static forms. The Listening and Reading tests for ACCESS Series 403 Paper are composed of the same sets of items, across all grade-level clusters and tiers, as ACCESS Series 401 Paper, which in turn is the same set of forms for Listening and Reading Tier A as ACCESS Series 303, with the exception that the cluster structure has been updated (see Section 1.5 above).

In all grade clusters, the Tier B/C forms in Listening and Reading are new forms for Series 403, but are composed of items that were previously operational in Series 400 and 401 and that were developed, as described above, during the development cycles when ACCESS was entirely paper based. Beginning with Series 403, to streamline operational administration, the ACCESS Paper Listening and Reading Tier B and Tier C tests were combined to create a new Tier B/C test in Listening and in Reading for each grade-level cluster.

In order to select these new forms, the pool of Listening and Reading Paper Tier B and Tier C items that were administered to the Series 401 and Series 400 populations was recalibrated using the population data (see Part 2 Section 2.7 for more information on the recalibration). A forms selection meeting was conducted in early 2018, prior to the operational administration of Series 403. Staff from WIDA and CAL reviewed the pool of items in Series 401 and 400 Listening and Reading Tier B and Tier C and selected two new static Tier B/C forms for each grade-level cluster in Listening and Reading—one for use in Series 403 and the other for use in the following operational school year. Forms were selected to maintain the coverage of WIDA ELD

Standards as called for in the test design and to ensure inclusion of items of sufficient difficulty to measure students in the Tier C range.

2.2.2. Writing

For Writing tasks, after external bias, sensitivity, and content reviews, tasks are subject to small-scale tryouts, led by CAL staff. In these tryouts, candidate folders are administered to students; student responses, as well as observations and interviews, inform further revisions to the folders. If tasks are deemed appropriate after tryouts, they then move to the field testing stage.

The Writing test for ACCESS Series 403 Paper is one of two static rotating forms. Writing Series 403 Paper is composed of the same set of items, across all grade-level clusters and tiers, as ACCESS Series 401 Paper and Online. The other static rotating form is the same set of items, across all grade-level clusters and tiers, as ACCESS Series 400 Paper and Online.

The Writing test for ACCESS Series 401 Paper and Online is composed of writing tasks from two sources. The first source is Writing tasks developed for Series 400, the first year in which ACCESS was offered in both Online and Paper formats. These tasks originally appeared on versions of ACCESS operational prior to Series 400, and they were adapted to be field tested in the online mode for ACCESS Series 400 Online. Writing field-tested tasks that were selected for use on the ACCESS Series 400 Online operational test were then laid out for presentation on ACCESS Series 400 Paper. A subset of these tasks continued to Writing Series 401 Paper. The second source for tasks on Writing Series 401 Paper is tasks that were field tested in a small-scale standalone field test prior to Series 401. The main purposes of this small-scale field testing were to (1) confirm that the tasks were functioning as intended, (2) identify preliminary exemplars that had the potential to be turned into anchors in operational scoring, and (3) inform the rating of the tasks when they became operational. For further detail on this field test, see the Series 401 Online ACCESS technical report (Center for Applied Linguistics, 2018).

2.2.3. Speaking

The Speaking test for ACCESS Series 403 Paper is likewise one of two static rotating forms. Speaking Series 403 Paper is composed of the same set of items, across all grade-level clusters and tiers, as ACCESS Series 401 Paper and Online. The other static rotating form is based on ACCESS Series 402 Paper.

The Speaking test for ACCESS Series 401 Paper was developed to be shared across the Online and Paper versions of ACCESS. Speaking tasks have some differences in presentation between

Online and Paper. In addition, the Paper test does not include the Speaking tier Pre-A, which is included on the Online test.¹

The development of Series 401 Online and Paper Speaking tasks followed the same trajectory as Writing, but unlike Writing, all Speaking tasks undergo large-scale field testing using the computer-based test format. Speaking tasks undergo both quantitative and qualitative analyses following the field test to determine their appropriateness for inclusion in the next year's operational test. After field testing, the Speaking tasks are then produced in the paper-based format.

2.3. Item and Task Design

This section describes how items and tasks are designed in order to collect the necessary evidence required for the purposes of the assessment. Items and tasks are discussed by language domain. Note that this section applies to ACCESS Paper Grades 1–12. For detail on the item and task design for Kindergarten, see Section 2.4 below and the technical report on the development of the Kindergarten static form (MacGregor, Kenyon, Gibson, & Evans, 2009).

2.3.1. Listening Items

All Listening items are multiple choice and are designed to be group administered.

All Listening items include a prerecorded stimulus passage and question stem. Listening items are selected-response items, with one key and two distractors as answer choices. Answer choices are primarily illustrations; for Grades 2–12, items that test listening proficiency at PLs 3–5 may consist of short written text response options that are written to be about two PLs lower than the targeted PL of the Listening item.

Each item on the Listening test is written to target the language of one of the five WIDA ELD Standards and to test a student's ability to process language at one of the five fully delineated proficiency levels. *Folders* group together three test items that are written around a common theme, with each item targeting a progressively higher proficiency level.

In ACCESS Paper, the Listening tests have a Tier A and a Tier B/C form for each grade-level cluster; students are placed into the tier based on a decision made at the school or district level.

Listening items are developed so that each folder appears on a two-page spread in a test booklet, although some folders go onto a third page. Scripts containing the item orientation, stimulus, and question stem are audio recorded with professional voice actors and produced by a professional recording studio. Audio playback of test item content is done via audio CD, and explicit

¹ Students with very low ability levels in the Listening and Reading domains are routed to the Pre-A tier for Speaking on the Online test. The purpose of the Pre-A tier is to reduce the affective impact of the test on these students. As the Paper test is not adaptive, there is no way to route these students to Pre-A for Paper.

instructions on starting and pausing the CD are provided in the Test Administrator’s Script and the Test Administrator Manual.

Listening items are centrally scored by Data Recognition Corporation (DRC) via an automated process.

2.3.2. Reading Items

All reading items are multiple choice and are designed to be group administered.

Reading items are similar in format to Listening items. Reading items are selected-response items, with one key and either two or three distractors, depending on grade-level cluster and targeted proficiency level. For Grades 1 and 2, all items have a key and two distractors. For Grades 3, 4–5, 6–8, and 9–12, items targeting PLs 1 and 2 have a key and two distractors, and items targeting PLs 3, 4, and 5 have a key and three distractors.

The stimulus for Reading items is written text, and answer choices primarily are also written text, though for Grades 1–12 response options for items targeting PLs 1, 2, and 3 may be illustrations rather than text. As with Listening items, Reading items are grouped into thematic folders of three test items each. In ACCESS Paper, the Reading tests have a Tier A and a Tier B/C form for each grade-level cluster; students are placed into the tier based on a decision made at the school or district level.

Reading items are centrally scored by DRC via an automated process.

2.3.3. Writing Tasks

All writing tasks are constructed response tasks and are designed to be group administered. Students write responses by hand in Paper booklets.

Writing tasks are designed to elicit language corresponding to one or more of the WIDA ELD Standards. Tasks appearing on the Tier A test form are designed to give students the opportunity to produce writing samples that fulfill linguistic expectations up to PL 3. As described in Section 2.1.3. above, these tasks are scored using the entire breadth of the scoring scale, therefore students may achieve proficiency levels higher than PL 3, although the tasks are not designed to elicit extended responses, so the scores are limited by task design. Tasks appearing on the Tier B/C form are designed to give students the opportunity to produce writing samples that fulfill linguistic expectations up to PL 4 or 5. Again, although these tasks are designed to elicit extended responses, they are scored on the entire breadth of the scoring scale, so students’ actual performances may extend above or below the PL 4-5 range.

In the spirit of providing maximal support and making every provision to ensure that students are given the opportunity to demonstrate the full extent of their written English language proficiency, modeling is sometimes used to make task expectations as clear as possible to students. For example, the first of a series of questions may already be partially completed, or a

sentence starter may be provided. In Grades 1–5, a word box may be provided, depending on the grade level, targeted proficiency level, and task.

For all grade clusters and tiers, the Writing test is group administered by a live test administrator. The test administrator reads instructions aloud from the Test Administrator’s Script and monitors student progress through the test. For all grade clusters and tiers, the students hand-write their answers in the same test booklet containing the Listening and Reading tests.

2.3.4. Speaking Tasks

The Speaking test is administered individually to each test taker. The test is media delivered. Students listen to an audio recording of the test input while following along in a test booklet.

Stimuli on the Speaking test include graphics, audio, and text, presented in a test booklet as a series of “speech bubbles” from the perspective of the virtual test administrator (VTA) and virtual model student. All text is multimodal, presented both in the test booklet and read aloud on the audio CD. Scripts containing the task content are audio recorded with professional voice actors and produced by a professional recording studio. Audio playback of test item content is done via audio CD, and explicit instructions on starting and pausing the CD are provided in the Test Administrator’s Script and the Test Administrator Manual.

The CD audio stimuli are presented in terms of a VTA. The VTA serves as a narrator who guides students through the test and acts as a virtual interlocutor. The VTA is introduced to students during the test directions in order to establish the testing context.

Task modeling is an essential component of the Speaking test design. In addition to the VTA, students are introduced to a virtual model student during the test directions. Prior to responding to each task, test takers first listen to the model student respond to a parallel task. The purpose of the model is to demonstrate task expectations to both test takers and to the test administrator, who scores the Speaking test. Students respond orally to the tasks, with their responses scored immediately by the test administrator using a scoring scale. The test administrator records scores on the Speaking test in the same booklet the student used for the Listening, Reading, and Writing tests.

2.4. Kindergarten

The Kindergarten test is a static form and is not refreshed from year to year. Field testing for Kindergarten ACCESS was conducted in 2008. A full description of item development, field testing, final forms selection, and initial standard setting for Kindergarten can be found in the technical brief *Development and Field Test of Kindergarten ACCESS for ELLs* (MacGregor et al., 2009). Cut scores for Kindergarten were most recently updated in the 2016 ACCESS standard setting (Cook & MacGregor, 2017); see Part 2 Section 2.1 for more information.

3. Assessment Performance: The Implementation of ACCESS

3.1. Test Delivery

Administration of ACCESS Paper takes place between December and April of the academic year, with testing windows determined at the state level. The domain tests may be administered in any order. The test may be administered in several sessions within a single day or over a series of days.

The Listening and Reading tests may be group or individually administered. Students are administered the Listening and Reading test forms using paper test booklets, and students record their answers directly in the test booklets. For the Listening test, the audio stimuli are played aloud via an audio CD.

The Writing test may be group or individually administered. Students are administered the Writing test via paper test booklets. Students record their responses directly in the test booklet.

The Speaking test is individually administered. Students listen to an audio recording and follow along in an accompanying test booklet. Each task also includes a model student response, which serves as an exemplar to the student and also as a benchmark to the test administrator who will score the task.

3.2. Scoring Procedures

3.2.1. Multiple-Choice Scoring: Listening and Reading

Listening and Reading items are scored dichotomously, as correct or incorrect. Students mark their answers directly in their test booklets, and each page is scanned into an electronic database. Scale scores for each domain are calculated based on the items that are administered to the test taker and the number of those items that the student answers correctly. For details on how scale scores for Listening and Reading are calculated, see Part 2 Chapter 2, “Analysis of Domains.”

3.2.2. Writing

Performance-based tasks in the domains of Writing are scored by trained raters. According to documentation from DRC, raters are well-educated professionals, with at least a 4-year college degree in a relevant field and a demonstrated writing ability. Prior to scoring live student responses, the raters undergo thorough training and qualifying. Training is task specific in order to ensure that raters understand the nuances of each unique Writing task. Team leaders, who are selected based on prior performance as raters and for their leadership skills, are assigned to small groups of raters; there are typically ten raters per team. The team leaders are responsible for monitoring the performance of their team members and providing ongoing feedback to support accurate scoring. Scoring directors are promoted from within DRC and earn their positions by

demonstrating quality work as raters and as team leaders on previous projects. Scoring directors are responsible for a specific set of tasks within a single domain. The scoring directors train and oversee the teams of raters assigned to these tasks. What follows are general scoring procedures utilized by DRC.

Rater Training and Qualifying

- Raters are seated at stations and are assigned unique ID numbers and passwords.
- The scoring director provides detailed directions for use of DRC’s computerized scoring system.
- The scoring director trains the raters using task-specific anchor sets and training sets.
- Raters must demonstrate scoring proficiency by scoring at least 70% agreement on a qualifying set before scoring live responses.
- Once raters are qualified, they are further trained for their grade-level cluster on the specific tasks for which they will rate responses.
- Once raters have trained, qualified, and begun live scoring, DRC uses calibration sets (of which there are two types, recalibration sets and validation sets, which are explained below) to keep the raters calibrated on the actual tasks they are scoring.

Calculating Score Agreement for Score Monitoring

- For Writing, agreement is defined as two adjacent scores. (See below for a description of the Writing Scoring Scale.) For example, using the Writing Scoring Scale, scores of 2 and 2+ would be considered agreement, as would scores of 2 and 2 or scores of 2+ and 3. Scores of 2 and 3 on the Writing Scoring Scale would be considered adjacent, and scores of 2 and 3+ would be considered nonadjacent.

Routing Responses to Ensure “Blind” Second Ratings

- The DRC scoring system ensures that responses are routed to qualified raters until the prescribed number of ratings is performed for all responses.
- Raters do not know if they are the first or second rater.

Monitoring Scoring (Quality Control)

- Ongoing quality control checks and procedures help monitor and maintain the quality of the scoring sessions. At least 20% of the responses are independently scored by two raters for the purpose of monitoring interrater reliability. DRC monitors these data daily.
- Responses can be retrieved on demand (e.g., specific grade-level clusters, specific students) should the need arise during or after the scoring process.
- If needed, responses can be rescored based on task- or response-level information, such as task number, date, score value assigned, or rater ID.

- For Writing, DRC uses both recalibration and validation sets. For each of the first 5 days that raters score a task, they take one recalibration set of five responses per task. After the raters take the recalibration sets, the scoring director or team leader reviews them using descriptors from the Writing Scoring Scale and the anchor responses to confirm the rationale behind each response’s score. Starting on the sixth day of scoring, DRC uses validity sets to monitor rater performance. These are sets of items seeded into the operational sets that, on a daily basis, monitor how raters are doing when compared to the known ratings of the validity sets. The raters do not know which items are operational and which are from a validation set.

Handling Unusual Responses

- Raters can forward responses to team leaders for assistance.
- Responses requiring special attention, including nonscorable responses, are routed to scoring directors for review and resolution.

The Writing Scoring Scale has six whole score points that range from 1 to 6. For responses that fall in between the whole score points, “plus” score points are available (e.g., a response that falls between 3 and 4 is scored as 3+). The scale descriptors include three different yet interrelated dimensions: discourse, sentence, and word/phrase. These scale descriptors guide raters as they consider all three dimensions in order to make holistic judgments about which score point best suits a response. The dimensions are distinguished as follows:

- The descriptors for the discourse dimension focus on the degree of organization and the extent to which the response is tailored to the context (e.g., purpose, situation, and audience).
- The descriptors for the sentence dimension evaluate the complexity and grammatical accuracy of sentence structures used in the response.
- The descriptors for the word/phrase dimension specify the range and appropriateness of the original vocabulary used (i.e., text other than that copied and adapted from the stimulus and prompt).

When assigning a score, a rater makes an initial judgment about which whole score point (1–6) best describes a response and then determines whether the three descriptors for that whole score point suit that response. If all three descriptors suit the response, a whole score point is awarded. If there is clear evidence that one or two descriptors from an adjacent score point are a better fit, a plus score point between the two applicable whole score points is awarded. In addition to scale descriptors, scoring rules address special cases where responses are nonscorable, completely or partially off task, and completely or partially off topic. Both nonscorable and completely off-task responses are scored as 0. Completely off-topic responses receive a maximum score of 2+. Partially off-topic responses are scored in their entirety, while partially off-task responses are scored by ignoring the off-task portion of the response and scoring only the on-task portion.

To calculate a raw score for the Writing test, raters' scores for each Writing task are converted to whole numbers ranging from 0–9, as shown in

Table 2.

Table 2
Rating to Raw Score Conversion (Writing)

Rating	Raw score
Nonscorable	0
1	1
1+	2
2	3
2+	4
3	5
3+	6
4	7
4+	8
5	9
5+	9
6	9

On Tier A tests, for all grade-level clusters except for Grade 1, the scores from the three tasks are added to calculate a total raw score, which can range from 0 to 27. For the Grade 1 Tier A test, there are four Writing tasks. The first two of these tasks use a modified version of the scoring scale and have score ranges of 0–1 and 0–3, respectively. The third and fourth tasks use the full scoring scale from 0–9; additionally, the last task is weighted as 3. Therefore, the possible final raw scores for Grade 1 Tier A range from 0 to 40.

On Tier B/C tests for all grade-level clusters, results from the different tasks are given different weights. These weights are specified to reflect intended amounts of time that a student should spend on each task. The first task is given a weight of 1, the second task is given a weight of 2, and the third task is given a weight of 3. Thus, for example, a student with raw scores of 5, 6, and 7 on the three tasks would have a total raw score of 38 ($[1 * 5] + [2 * 6] + [3 * 7]$), while a student with raw scores of 7, 6, and 5 on the three tasks would have a total raw score of 34 ($[1 * 7] + [2 * 6] + [3 * 5]$). Raw scores on the Tier B/C tests can range from 0 to 54.

The ACCESS Writing Scoring Scale is distinct from the WIDA Writing Rubric, which is a tool for evaluating student writing in classrooms and for interpreting student scores from ACCESS Online. The Writing Scoring Scale was designed specifically as a scoring tool and is not appropriate for any other purposes.

3.2.3. Speaking

Speaking responses are immediately scored by the administrator while the test is administered. After listening to the student's responses, the administrator assigns a score. The Speaking test is scored using a scoring scale that is designed to evaluate student responses relative to the model student's response. As part of test administration, the test administrators hear the model student response before each student response, which supports them in assigning an appropriate score relative to the model response.

The Speaking Test is the only portion of ACCESS Paper that is scored locally. Test administrators must complete the relevant virtual ACCESS Paper test administrator training module for the Speaking test and pass the accompanying quiz (either Grades 1–5 or Grades 6–12). The training focuses on developing the test administrators' ability to score the test reliably. Separate training materials are available that address test administration and monitoring procedures. To reliably score the test, test administrators are trained on the Speaking Scoring Scale. Training materials are available for each grade-level cluster, and raters listen to anchor samples and view score justifications that provide detailed explanations for scores based on the scoring scale. Practice samples are also available so that raters can practice assigning scores. The course includes both required training material for each grade-level cluster as well as optional training material. Raters are required to complete training sections for each grade-level cluster they will administer and score. However, if a rater will score more than three grade-level clusters, they may complete rater training for only three. The quizzes include 12 items in which raters listen to and assign a score to a task response. The pass rate for the quiz is 80% correct.

The Speaking Scoring Scale defines five score points: *Exemplary*, *Strong*, *Adequate*, *Attempted*, and *No Response (in English)*. These score points are applied based on the proficiency level expectations of each task, that is, the level of language proficiency that each task is designed to elicit. These expectations are exemplified by the model student response (see Section 2.3.4). In this way, the model response serves as a scoring benchmark. Raters listen to the model response and score test taker responses relative to the model. A score of *Exemplary* means that the student response demonstrates English language use that is equal to or beyond the English language use illustrated by the model student's response.

The Speaking Scoring Scale includes descriptors for overall language use, response sophistication, language delivery, and word choice. As stated above, the scale is applied relative to the proficiency level demands of the task. For tasks targeting language elicitation at PL 1, there are only three possible score points: *No Response*, *Attempted*, and *Adequate and Above*. This is the case because appropriate responses to PL 1 tasks are single words and short chunks of language, so it is not possible to reliably distinguish between *Adequate*, *Strong*, and *Exemplary* performance.

To calculate a raw score for the Speaking test, the five score points are converted to whole numbers, as shown in

Table 3. To calculate a total raw score, the raw scores for each task are added together; additionally, in Tier B/C, six points are added to the total raw score, representing a score of *Adequate and Above* for three tasks targeting language at PL 1. Though a Tier B/C student would not be administered any tasks targeting the PL 1 level, it is assumed that a score of *Adequate and Above* would be applicable to such tasks. Thus, on the Tier A test, scores can range from 0 to 18; and on the B/C test, from 6 to 30.

Table 3
Rating to Raw Score Conversion (Speaking)

Rating	Raw score
No Response (in English)	0
Attempted	1
Adequate	2
Strong	3
Exemplary	4

Speaking tasks are scored using the ACCESS Speaking Scoring Scale. The Speaking Scoring Scale is distinct from the WIDA Speaking Rubric, which is a tool for classroom use and score interpretation. The Speaking Scoring Scale was designed specifically for test scoring use and is not intended for classroom purposes.

3.3. Operational Administration

3.3.1. Listening Test Administration

The ACCESS for ELLs Paper Listening test is media delivered. Listening test items are delivered via CD.

3.3.1.1. Listening Test Materials

Test materials include the following items:

- Test Administrator’s Script
- Student Test Booklet(s)
- Listening and Speaking Test CD (a separate CD for each grade-level cluster and tiered test form). In the rare event that a student requires a human reader as an accommodation, the Recording Script is required to administer the Listening section individually for that particular student.
- At least one sharpened number 2 pencil for each student to mark responses
- Speakers
- A CD player or desktop/laptop computer (to play the CD)

3.3.1.2. Organization and Timing of the Listening Test

The Listening test is designed to take approximately 25 to 40 minutes, depending on the grade-level cluster and tier. The length of test items increases with students' language proficiency and grade level. For example, the Tier B/C Listening test takes longer to administer than the Tier A Listening test, and the Listening test for Grades 9–12 may take slightly longer than the test for Grades 4–5.

3.3.2. Reading Test Administration

The ACCESS for ELLs Reading test is completed within Student Test Booklets after a scripted introduction by the Test Administrator.

3.3.2.1. Reading Test Materials

Reading test materials include the following items:

- Test Administrator's Script
- Student Test Booklet(s)
- At least one sharpened number 2 pencil for each student to mark responses

3.3.2.2. Organization and Timing of the Reading Test

The Reading test is designed to take no more than 35 to 45 minutes. The test administration time does not include time for convening students, taking attendance, distributing and collecting test materials, explaining test directions, or completing practice items.

3.3.3. Writing Test Administration

Students respond to a set of tasks, writing their responses in their Student Test Booklets.

3.3.3.1. Writing Test Materials

Writing test materials include the following items:

- Test Administrator's Script
- Student Test Booklet(s)
- At least one sharpened number 2 pencil for each student to write responses
- Scratch paper

3.3.3.2. Organization and Timing of the Writing Test

There are three tasks (Parts A, B, and C) on each Tier (Tiers A and B/C) of the Writing test for all grade levels except Tier A for Grade 1, which contains four tasks. For grade-level clusters 2, 3, 4–5, 6–8, and 9–12, the Tier A Writing tests have recommended guidelines for Parts A, B, and C of 15 minutes each, with up to 5 additional minutes for each part if needed for students to

finish writing, for a total of 60 minutes. For all grade-level clusters, the Tier B/C Writing tests have recommended timing guidelines for Parts A, B, and C of 10, 20, and 30 minutes, respectively.

3.3.4. Speaking Test Administration

The ACCESS for ELLs Speaking test is an individually administered test that standardizes test administration across students. Speaking test items are media delivered. Speaking test audio is provided on the same CD as the Listening test. The Speaking test provides ELLs with the opportunity to demonstrate their academic English language proficiency in speaking across the WIDA ELD Standards through a set of constructed-response tasks. The Speaking test is tiered. Students will either take the Tier A form or the Tier B/C form; both are included in the same Speaking Test Booklet.

3.3.4.1. Audio Format of the Speaking Test

The Speaking test is multimodal. The student hears audio input and also sees the input as text in the Speaking Test Booklet. This presentation format supports the student in understanding test input. Media delivery of the Speaking test means that an audio recording will guide the student through the Speaking test. The audio recording includes two voices: a model student and a virtual test administrator.

Each task on the Speaking test is preceded by a model student task and response. The questions posed to the model student are at the same proficiency level as the tasks to which the student will respond, allowing the model student to demonstrate the expected language use at a given proficiency level. In most cases the model questions are designed to be parallel to but not exactly the same as the examinee questions. The model student also has an important function in scoring, since the scoring scale is designed to evaluate student responses relative to the model student's response.

The virtual test administrator guides the student through the test and asks the student questions designed to elicit language at targeted proficiency levels. While the virtual test administrator will instruct and guide the student through the Speaking test, the administrator may also need to assist the student in navigating test materials (e.g., turning the page when prompted). The Speaking test includes standardized, built-in response time for every task. The amount of time varies according to the grade-level cluster, tier, and proficiency level of the task and ranges from 15 to 50 seconds in Grades 1–3 and from 15 to 45 seconds in Grades 4–12. Students may not require the entire time allotted. After the response time has ended, the test audio will automatically continue to the next Speaking task.

3.3.4.2. Speaking Test Materials

Speaking test materials include the following items:

- Test Administrator's Script

- Speaking Test Booklet (contains test graphics and prompts)
- Student Test Booklet (contains Speaking test scoring sheet and scoring scale)
- Listening and Speaking test CD (a separate CD for each grade-level cluster and tiered test form). In the rare event that a student requires a human reader as an accommodation, the Recording Script is required to administer the Speaking section.
- A CD player or desktop/laptop computer (to play the CD)
- Speakers

3.3.4.3. Organization and Timing of the Speaking Test

Speaking tasks on the Speaking test are contained within three parts: A, B, and C. As in other domains of ACCESS for ELLs, tasks on the Speaking test are grouped thematically. Each part addresses one or more of the WIDA ELD Standards and contains two tasks. In all, the Speaking test contains six individual tasks across the three parts. Each task is associated with a proficiency level (1, 3, or 5) and includes one or two questions to which the student responds. Student questions are indicated by a blue speech bubble in the test booklet.

The Speaking test is designed to take approximately 15 to 35 minutes per student, but the actual time will depend on the grade-level cluster and tier of the test administered. Note that the approximate test administration time does not include setting up the test session or explaining test directions. An additional 10 minutes should be allocated to set up the Speaking test.

3.3.5. Test Administrator Training

To prepare individuals to serve as test administrators, test administrator training for ACCESS Series 403 Paper is conducted through online training modules hosted on the WIDA website. Three certifications are offered to participants: a group test administration certification pertaining to the Listening, Reading, and Writing portions of ACCESS; a certification for the Speaking test; and a certification for the Kindergarten test. In order to receive any of the three certifications, participants have to complete the relevant online course and pass a quiz after completing the course.

3.3.6. Test Security

Every effort is made to keep the test secure at all levels of development and administration. WIDA, CAL, and DRC (the entity responsible for printing, distributing, collecting, and scoring the printed tests) follow established policies and procedures regarding the security of the test, and every individual involved in the administration of ACCESS, from the district level to the classroom level, is trained in issues of test security.

All materials for ACCESS for ELLs are considered secure test materials. All users of the WIDA website are prompted to read and sign a Non-Disclosure and User Agreement (NDUA) upon their first login. Use of the WIDA Assessment Management System (WIDA AMS) and

INSIGHT test engine are also subject to the terms of use outlined in the WIDA AMS. Users are prompted to agree with the test security policy upon their first login. The security of all test materials must be maintained before, during, and after the test administration. Under no circumstances are students permitted to handle secure materials before or after test administration. Test materials should never be left unsecured. The test coordinator should track each secure booklet on the ACCESS for ELLs Security Checklist. Individuals are responsible for the secure documents assigned to them. Secure documents should never be destroyed (e.g., shredded, thrown in the trash) except for soiled documents, which must be destroyed in a secure manner. District and school personnel carrying out their roles in the delivery of this assessment must follow ACCESS for ELLs District and School Test Coordinator Manual guidelines to maintain test security.

3.4. Procedures for Including Students with Disabilities

The WIDA Accessibility and Accommodations Framework provides support for all ELLs, as well as targeted accommodations for students with individualized education plans (IEP) or 504 plans. These supports are intended to increase accessibility for assessments for all ELLs. (Please see the Accessibility and Accommodations Supplement for detailed information.)

3.4.1. Support Provided to All ELLs

Universal design. ACCESS for ELLs incorporates universal design principles in order to provide greater accessibility for all ELLs. The test items are presented using multiple modalities, including supporting prompts with appropriate animations and graphics, embedded scaffolding, tasks broken into chunks, and modeling that uses task prototypes and guides.

Administrative considerations include adaptive and specialized equipment or furniture, alternative microphone, familiar test administrator, frequent or additional supervised breaks, individual or small group setting, monitoring of the placement of responses in the test booklet or on screen, participation in different testing formats (Paper vs Online), reading aloud to self, specific seating, short segments, verbal praise or tangible reinforcement for on-task or appropriate behavior, and verbal redirection of students' attention to the test (in English or native language).

Universal tools are available to all students taking ACCESS for ELLs and Kindergarten ACCESS for ELLs in order to address their individual accessibility needs. These may either be embedded in the online test or provided by test administrators during testing. Universal tools do not affect the construct being measured on the assessment.

Audio aids, color contrast, color overlay, highlighters, colored pencils or crayons, line guide or tracking tool, low-vision aids or magnification devices, sticky notes, and scratch paper are the universal tools that are used in Paper administration.

3.4.2. Support Provided to ELLs with IEP or 504 Plans

Accommodations include allowable changes to the test presentation, response method, timing, and setting in which assessments are administered. Accommodations are intended to provide testing conditions that do not result in changes in what the test measures; that provide comparable test results to those of students who do not receive accommodations; and that do not affect the validity and reliability of the interpretation of the scores for their intended purposes. Accommodations are available only to ELLs with disabilities who have an approved IEP or 504 plan, and only when the student requires the accommodation(s) to participate in ACCESS for ELLs meaningfully and appropriately. Accommodations are delivered locally by a test administrator.

Accessibility features include tools that are available to all ELLs taking ACCESS for ELLs. Accessibility features are provided to ELLs by test administrators for paper-based tests. All accessibility features are available to all ELLs during testing; specific designation is not required prior to testing to make them available to the student. Features available during paper-based test administration include the following:

- Audio amplification device (provided by student)
- Highlighter, colored pencils, or crayons
- Place marker (blank)
- Low-vision aids or magnification device
- Color overlay
- Equipment or technology that the student uses for other tests and school work, e.g., adapted pencil (altered size or grip), slant board, wedge, etc.
- Scratch/blank paper (submit with test or dispose according to state policy)

Allowable test administration procedures are variations in standard test administration procedures that provide flexibility to schools and districts in determining the conditions under which ACCESS for ELLs can be administered most effectively. These procedures are available to any student, as needed, at the discretion of the test coordinator (or principal or designee), provided that all security conditions and staffing requirements are met. Examples of allowable test administration procedures include tests administered by familiar school personnel, in an individual or small group setting, in a separate room, with frequent supervised breaks, or in short segments. For detailed information on the allowable test administration procedures, consult the ACCESS for ELLs Test Administration Manual.

Schools and districts should consider how accessibility features and allowable test administration procedures can support accessibility to the test for all ELLs. The accommodations, accessibility features, and allowable test administration procedures are based on (1) accepted practices in ELP assessment; (2) existing accommodation policies of WIDA Consortium member states; (3) consultation with representatives of WIDA member states who are experts in the education and

assessment of ELLs and students with disabilities; and (4) the expertise of the test developers at the Center for Applied Linguistics.

WIDA also offers *Alternate ACCESS for ELLs*. This test is intended only for those ELLs who have cognitive disabilities that are so significant as to prevent meaningful participation in ACCESS testing, even with accommodations. The results of the Alternate ACCESS for ELLs operational administration appear in a separate technical report.

4. Summary of Score Reports

4.1. Individual Student Report

The Individual Student Report contains detailed information about the performance of a single student within Grades K–12. Its primary users are students, parents/guardians, teachers, and school teams. It describes one indicator of a student’s English language proficiency, the language needed to access content and succeed in school.

In the score report, there are four domain and four composite scores. Each composite score is represented by a label, a breakdown of how individual domains are used to calculate it, and a visual display of the results.

The proficiency level is presented both graphically and as a whole number followed by a decimal. The shaded bar of the graph reflects the exact position of the student’s performance on the six-point ELP scale. The whole number reflects a student’s ELP level (1–Entering, 2–Emerging, 3–Developing, 4–Expanding, 5–Bridging, and 6–Reaching) in accord with the WIDA ELD Standards. ELLs who attain Level 6, Reaching, have moved through the entire second language continuum, as defined by the test and the WIDA ELD Standards.

The decimal indicates the proportion within the proficiency level range that the student’s scale score represents, rounded to the nearest tenth. For example, a proficiency level score of 3.5 is halfway between the 3.0 and 4.0 cut scores.

To the right of the proficiency level is the reported scale score and associated confidence band. The confidence band reflects the standard error of measurement of the scale score, a statistical calculation of a student’s likelihood of scoring within a particular range of scores if he or she were to take the same test repeatedly without any change in ability.

If a student does not complete one or more language domains, NA (not available) is inserted in that language domain as well as all applicable composite scores, including the overall score. Students with identical overall scores may have very different profiles in terms of their oral language and literacy development.

The Individual Student Report also provides information about the proficiency levels as whole numbers obtained by the student and describes what many students at the reported proficiency level may be expected to be able to do in English. For example, if the student received a proficiency level score of 2 for Speaking, the report will include a description of the type of spoken language the student may be expected to be able to produce. Figure 7 shows a sample Individual Student Report.

Sample Student

Birth Date: mm/dd/yyyy | Grade: sample grade
Tier: sample tier
District ID: XXXXXXXXXXXXXXXX | State ID: XXXXXXXXXXXXXXXX
School: sample school
District: sample district
State: sample state

Individual Student Report 20XX

This report provides information about the student's scores on the ACCESS for ELLs 2.0 English language proficiency test. This test is based on the WIDA English Language Development Standards and is used to measure students' progress in learning English. Scores are reported as Language Proficiency Levels and as Scale Scores.

Language Domain	Proficiency Level (Possible 1.0-6.0)						Scale Score (Possible 100-600) and Confidence Band See Interpretive Guide for Score Reports for definitions					
	1	2	3	4	5	6	100	200	300	400	500	600
Listening	4.0						368					
Speaking	2.2						320					
Reading	3.4						356					
Writing	3.5						355					
Oral Language 50% Listening + 50% Speaking	3.2						344					
Literacy 50% Reading + 50% Writing	3.5						356					
Comprehension 70% Reading + 30% Listening	3.7						360					
Overall* 35% Reading + 35% Writing + 15% Listening + 15% Speaking	3.4						352					

*Overall score is calculated only when all four domains have been assessed. NA: Not available

Domain	Proficiency Level	Students at this level generally can...
Listening	4	understand oral language in English related to specific topics in school and can participate in class discussions, for example: <ul style="list-style-type: none"> • Exchange information and ideas with others • Connect people and events based on oral information • Apply key information about processes or concepts presented orally • Identify positions or points of view on issues in oral discussions
Speaking	2	communicate ideas and information orally in English using language that contains short sentences and everyday words and phrases, for example: <ul style="list-style-type: none"> • Share about what, when, or where something happened • Compare objects, people, pictures, events • Describe steps in cycles or processes • Express opinions
Reading	3	understand written language related to common topics in school and can participate in class discussions, for example: <ul style="list-style-type: none"> • Classify main ideas and examples in written information • Identify main information that tells who, what, when or where something happened • Identify steps in written processes and procedures • Recognize language related to claims and supporting evidence
Writing	3	communicate in writing in English using language related to common topics in school, for example: <ul style="list-style-type: none"> • Describe familiar issues and events • Create stories or short narratives • Describe processes and procedures with some details • Give opinions with reasons in a few short sentences

Figure 7. Individual Student Report.

When interpreting scores, the following points should be kept in mind:

- The report provides information on English proficiency. It does not provide information on a student's academic achievement or knowledge of content areas.
- Students do not typically acquire proficiency in Listening, Speaking, Reading, and Writing at the same pace. Generally,
 - Oral language (L+S) is acquired faster than literacy (R+W).
 - Receptive language (L+R) is acquired faster than productive language (S+W).
 - Writing is usually the last domain to be mastered.
- The students' foundation in their home or primary language is a predictor of their English language development. Those who have strong literacy backgrounds in their native language will most likely acquire literacy in English at a quicker pace than students who do not.
- The Overall score is helpful as a summary of other scores and is used because a single number may be needed for reference. However, it is important to remember that it is compensatory; a particularly high score in one domain may effectively raise a low score in another. Similar overall scores can mask very different performances on the test.
- No single score or language proficiency level, including the Overall score (composite), should be used as the sole determiner for making decisions regarding a student's English language proficiency. School work and local assessment throughout the school year also provide evidence of a student's English language development.
- Scale scores from different domains should not be compared. Each domain has its own scale, so scale scores should not be compared, such as comparing Listening to Reading. Proficiency level scores can be used for such comparisons.
- To compare test scores from different years, either scale scores or proficiency level scores can be used, although it is easier to see changes when examining scale scores.

For detailed information about score reports, please refer to the Interpretive Guide.

4.2. Other Reports

Student Roster Report. The Student Roster Report contains information on a group of students within a single school and grade. It provides scale scores for individual students in each language domain and composite, identical to those in the Individual Student Report. Its intended users are teachers, program coordinators/directors, and administrators.

Frequency Reports. The primary audience for frequency reports is typically program coordinators/directors, administrators, and boards of education. There are three types of frequency reports:

- School Frequency Report
- District Frequency Report
- State Frequency Report

They all show the number and percentage of tested students who attain each proficiency level within a given population.

4.2.2.	WIDA Screener Online and WIDA ACCESS for ELLs: Examining the Relationship between Student Scores on Two Assessments.....	4-3
4.2.3.	2018 ACCESS for ELLs 2.0 Speaking Study	4-3

1. Student Participation and Performance

In this section of the report, detail is provided on students' participation in the assessment and on scale score and proficiency level results. These data are disaggregated in several ways, including by grade-level cluster, grade and tier, and also by gender, ethnicity, and race.

Analyses use the Census Bureau approach to reporting race and ethnicity. Ethnicity is conceptualized as a binary category (Hispanic or non-Hispanic). There are five categories for race: American Indian/Alaskan Native, Asian, Black/African American, Pacific Islander/Hawaiian, and White. The race and ethnicity categories are not mutually exclusive. Thus, for example, Student A may be labeled as Hispanic for ethnicity and Asian for race, while Student B may be labeled as non-Hispanic for ethnicity and both American Indian/Alaskan Native and Black/African American for race. Starting with Series 202, students who are labeled as Hispanic are included in the Hispanic (of any race) category, regardless of how many racial categories they are included in. Students who are identified as one of the racial categories (e.g., Asian) and have not been identified as Hispanic are identified in only one racial category; if they are identified in more than one racial category, and have not been identified as Hispanic, then they are labeled non-Hispanic multiracial.

A total of 23 students were excluded from the analyses due to mismatches in students' tiers across domains.

1.1. Participation

Participation in ACCESS Paper is shown in three ways: by grade-level cluster, by grade, and by tier. Participation data are reported by state, by gender, and ethnicity.

1.1.1. Grade-Level Cluster

Table 1.1.1.1 shows participation across the 39 WIDA states and U.S. territories that participated in the operational testing program of ACCESS Paper in 2018–2019 by grade level. The rows provide data for the number of students in that grade-level cluster who took the test by state, with the final row showing the total number of participants across all 39 states and territories. Some states' sample sizes are small except for kindergarten, which is only in Paper form, since most students take the Online form of the tests.

Table 1.1.1.2 shows participation by grade-level cluster and by gender across all states and territories for the population of students who participated in ACCESS Paper, while Table 1.1.1.3 shows participation by grade-level cluster and by ethnicity.

1.1.3. Tier

This section provides information on participation by tier. The tables show this information in several ways:

- By grade-level cluster, tier, and domain
- By grade, tier, and domain
- By grade-level cluster and tier for gender
- By grade-level cluster and tier for ethnicity

1.2. Scale Score Results

1.2.1. Mean Scale Score Across Domain and Composite Score by Cluster

This section shows mean (average) scale scores by grade-level cluster across the eight scores awarded on ACCESS, first for the four domains (Listening, Speaking, Reading, and Writing) and then for the four composites (Oral Language, Literacy, Comprehension, and Overall). The mean scale scores are expected to increase as grade increases, as ACCESS is vertically scaled; however, there is also an intersection between this principle and the population of test takers. In this section, under each average, the number of students in each group is also given. Tables are provided for the total student population, for the student population by gender, and for the student population by race and ethnicity.

1.2.2. Mean Scale Score Across Domain and Composite Score by Grade

This section shows the mean scale scores broken down by grade rather than by grade-level cluster. Tables are provided for the total student population, for the student population by gender, and for the student population by race and ethnicity.

Table 1.2.2.1

1.2.3. Correlations

The tables in this section show Pearson correlations among the four domain scale scores by grade-level clusters across all tiers, as well as the number of students included in each correlation. Results are provided by grade-level cluster.

Table 1.2.3.1

Correlations Among Scale Scores: K, S403 Paper

		Listening	Reading	Writing	Speaking
Listening	Pearson Correlation	1	.521	.558	.774
	N	232,469	232,457	232,458	232,464

1.3. Proficiency Level Results

Proficiency level results show the distribution of students falling into the six language proficiency levels outlined by the WIDA ELD Standards. The results are presented in eight subsections—four domains and four composites--by count and percentage.

Each table in this section shows either the number or percentage of students classified into each language proficiency level.

Results are first presented by grade-level cluster and tier, then by grade and tier, and then by grade alone.

2 Analysis of Domains

The measurement model that forms the basis of the analysis for the development of ACCESS for ELLs is the Rasch measurement model (Wright & Stone, 1979). Additional information on its use in the development of ACCESS for ELLs is available in WIDA Consortium Technical Report No. 1, *Development and Field Test of ACCESS for ELLs* (Kenyon, 2006). The test was developed using Rasch measurement principles, and in that sense, the Rasch model guided decisions throughout the development of the assessment and was not just a tool for the statistical analysis of the data. Thus, for example, data based on Rasch fit statistics guided the inclusion, revision, or deletion of items during the development and field testing of the test forms. All Rasch analyses are conducted using the Rasch measurement software program *Winsteps* (Linacre, 2006).

Rasch Model for Dichotomous Scoring

For Listening and Reading, the dichotomous Rasch model was used as the measurement model. Mathematically, the measurement model may be presented as

$$\log\left(\frac{P_{ni1}}{P_{ni0}}\right) = B_n - D_i$$

where

P_{ni1} = probability of a correct response “1” by person “n” on item “i”

P_{ni0} = probability of an incorrect response “0” by person “n” on item “i”

B_n = ability of person “n”

D_i = difficulty of item “i”

When the probability of a person getting a correct answer equals the probability of a person getting an incorrect answer (i.e., 50% probability of getting it right and 50% probability of getting it wrong), P_{ni1}/P_{ni0} is equal to 1. The log of 1 is 0. This is the point at which a person’s ability equals the difficulty of an item. For example, a person whose ability is 1.56 on the Rasch logit scale encountering an item whose difficulty is 1.56 on the Rasch logit scale would have a 50% probability of answering that question correctly.

Rasch Model for Polytomous Scoring

For the Writing and Speaking tasks, a Rasch-grouped rating scale model is used. Mathematically, this can be represented as

$$\log\left(\frac{P_{ngik}}{1 - P_{ngi(k-1)}}\right) = \beta_n - D_{gi} - F_{gk}$$

where

P_{ngik} = probability of person “n” on task “i” receiving a rating at level “k” on rating scale “g”

$P_{ngi(k-1)}$ = probability of person “n” on task “i” receiving a rating at level “k – 1” on rating scale “g” (i.e., the next lowest rating)

β_n = ability of person “n”

D_{gi} = difficulty of task “i” specific to rating scale “g”

F_{gk} = calibration of step “k” on rating scale “g”

The subscript “g” is a group index specifying the group of tasks to which task “i” belongs. It also identifies the scoring scale that was used for the group of tasks.

As described in Part 1 Section 3.2.2, ratings on the ACCESS Writing Scoring Scale range from 0, 1, 1+, ..., 6 and the possible raw scores range from 0 to 9. All Writing tasks are scored using this scoring scale except for Grade 1 Tier A Tasks 1 and 2. The profiles of the responses to these two tasks do not fit the generic scoring scale well, so additional task-specific instructions are provided to raters. These instructions guide raters in applying a limited number of score points on the scoring scale to responses elicited by these two tasks. The possible ratings for Grade 1 Tier A Task 1 are 0 or 1, and the possible ratings for Grade 1 Tier A Task 2 are 0, 1, 1+, or 2. To simplify the year-to-year linking process, the Grade 1 Writing Tier A Task 1 is treated as a dichotomously scored task. The Grade 1 Writing Tier A Task 2 is modeled using a rating scale with a possible raw score of 0 to 3. All other Writing tasks are modeled using a rating scale with possible raw scores of 0 to 9. Thus, a total of two rating scales are modeled for ACCESS Writing. One rating scale is associated with the Grade 1 Writing Tier A Task 2, and the other rating scale is associated with all Writing tasks that are scored using the rating scale with raw score values of 0–9.

For Speaking, Proficiency Level (PL) 1 tasks are modeled as a group on a 0–2 scale, and PL 3 and PL 5 tasks are modeled as a group on a 0–4 scale (see Part 1 Section 3.2.3).

Scale Scores and Proficiency Level Scores

Scale scores are calculated by transforming the person ability estimate via a scaling equation.

For Paper ACCESS Grades 1–12, the following scaling equations are used to convert ability measures in logits to scale scores:

- L: (Ability Measure in Logits * 37.571) + 316.637
- R: (Ability Measure in Logits * 26.000) + 323.272
- W: (Ability Measure in Logits * 26.851) + 303.332
- S: (Ability Measure in Logits * 29.248) + 265.076

In the domains of Listening and Reading, the current ACCESS scale was established for the original paper-only version of the test and was maintained through the transition to an online and paper-delivered test in the 2015–16 school year (Series 400). Evidence for scale maintenance in the transitional year is described elsewhere (Center for Applied Linguistics, 2016). In the

domains of Writing and Speaking, a study was conducted in the summer of 2016 to reconstruct the logit scale (see Center for Applied Linguistics, 2017).

Note that these new scales were not applied to the Kindergarten test, which is a static form. The following scaling equations are used for the Kindergarten test:

- L: (Ability Measure in Logits * 37.571) + 316.637
- R: (Ability Measure in Logits * 26.000) + 323.272
- W: (Ability Measure in Logits * 31.097) + 317.068
- S: (Ability Measure in Logits * 20.084) + 322.686

Proficiency level scores are interpretations of these scale scores in terms of the proficiency levels described in the WIDA ELD Standards. These interpretations are derived from a series of standard setting studies, in which educators reviewed evidence from the test, either in the form of items for the selected response sections (Listening and Reading) or student portfolios for the constructed response sections (Writing and Speaking), to establish cut scores between the proficiency levels. The first standard setting study for ACCESS took place in 2005; it established cut scores for all four domains by grade-level cluster (Kenyon, 2006). The second cut score study took place in 2007; it established cut scores for all four domains by grade level (Kenyon, Ryu, & MacGregor, 2013). These cut scores were used to derive proficiency level scores through the 2015–16 administration (Series 400) of ACCESS for ELLs. A third cut score study was conducted in summer 2016 (Cook & MacGregor, 2017). The purpose of this study was to re-examine cut scores for each of the proficiency levels in light of the migration from the paper-and-pencil-only assessment to both online and paper delivery, the revision of the Speaking test, and the influence of college- and career-ready standards. These new cut scores were first used for ACCESS Series 401 (2016–2017 school year).

A proficiency level score consists of a two-digit decimal number (e.g., 4.5). The first digit represents the student’s overall proficiency level range based on the student’s scale score. The number to the right of the decimal is an indication of the proportion of the range between cut scores that the student’s scale score represents. A score of 4.5, for example, tells us that the student is in PL 4 and that his or her scale score is halfway between the cut scores for Levels 4 and 5.

Unlike the scale scores, which form an interval scale and are continuous across grades from Kindergarten to Grade 12, proficiency level scores are dependent upon the grade a student was in when the assessment was administered. For example, a score of 350 in Listening would be interpreted as a PL score of 5.8 for a Grade 2 student, a 3.8 for a Grade 5 student, a 3.1 for a Grade 8 student, and a 2.3 for a Grade 12 student.

Because the bands between cut scores on the score scale vary in width, proficiency level scores should not be considered to form an interval scale. That is, the distance between PL scores 1.5 and 2.5 cannot be assumed to be equal to the distance between PL scores 2.5 and 3.5. Only scale scores should be used as interval measures. PL scores are at even intervals within a grade and

proficiency level (e.g., in Grade 3, the distance between 3.1 and 3.2 is the same as the distance between 3.7 and 3.8), but they do not form an interval scale across proficiency levels.

2.1 Complete Item or Task Analysis and Summary

The tables in this section provide a summary of the analyses of the items (for Listening and Reading) or tasks (for Writing and Speaking), along with analyses of each item or task. These tables have either two parts (in the case of Listening and Reading) or three parts (in the case of Writing and Speaking). The first part of the table gives a summary of the total set of items or tasks on the form. The second part provides statistics pertaining to the individual items or tasks, and the third part (for Writing and Speaking only) expresses raw score distributions by task.

Statistics included across these three parts include item or task difficulties in logits, the number of items or tasks on the form, the average p value (for forms with selected-response items), and the Rasch model fit statistics.

All Rasch analyses were conducted using the Rasch measurement software program *Winsteps* (Linacre, 2006). Rasch statistics are presented in several of the tables that follow. When speaking of the measure of examinee ability, we use the term *ability measure* (rather than *theta* used commonly when discussing models based on item response theory). When speaking of the measure of how hard an item is, we use the term *item difficulty measure* (rather than the *b parameter* used commonly when discussing models based on item response theory). *Step measures* refer to the calibration of the steps in the Rasch Rating Scale model presented above. All three measures (ability, difficulty, and step) are expressed in terms of Rasch logits, which then are converted into scores on the ACCESS score scale for reporting purposes.

Fit statistics for the Rasch model are calculated by comparing the observed empirical data with the data that would be expected to be produced by the Rasch model if the data fit the model perfectly. Outfit mean square statistics are influenced by outliers. For example, a difficult item that some low-ability examinees get correct—for reasons unknown—will have a high outfit mean square statistic. Infit mean square statistics are influenced by unexpected patterns of observations by persons on items that are roughly targeted for them and generally indicate a more serious measurement problem. The expectation for both of these statistics is 1.00, and values near 1.00 are not of great concern. Values less than 1.00 indicate that the observations are too predictable and thus redundant, but are not of great concern. High values are of greater concern.

Linacre (2002) provided more guidance on how to interpret these statistics for dichotomous items. He writes:

- Values greater than 2.0 “distort or degrade the measurement system.”
- Values between 1.5 and 2.0 are “unproductive for construction of measurement, but not degrading.”
- Values between 0.5 and 1.5 should be considered “productive for measurement.”
- Values below 0.5 are “less productive for measurement, but not degrading.”

Linacre also stated in his guidance that infit problems are more serious to the construction of measurement than are outfit problems.

Because conservative guidelines were followed in the development of ACCESS for ELLs, the vast majority of dichotomous items on the test forms have mean square fit statistics in the range of 0.5 and 1.5; thus, they fit the range that is “productive for measurement” according to the guidelines above.

Since performance tasks are constructed and scored very differently from dichotomous items, it is not as straightforward to apply this same guidance to interpret these fit statistics to performance tasks that are scored polytomously. Some performance tasks that were designed to elicit a restricted range of performances (for example, very easy tasks, for which it is expected that most students will get the highest score) can cause the model to predict the data too well (overfitting). Conversely, when performance tasks are scored using a very wide rubric scale, such as the case with ACCESS for ELL Writing tasks, sometimes unmodeled noise or other sources of variance in the data will cause the model to underpredict the data (underfitting). Overall, for ACCESS for ELL performance tasks, overfitting is more common than underfitting. Underfitting indicates that the task is less productive for measurement, but it is not degrading to the measurement of student performance.

Tables in this section are presented by test form (i.e., by grade cluster and tier) for Listening, Reading, and Writing. For the Speaking test, due to the design of the test, a number of items are shared between tiers. In order to best present the results of the Speaking task analysis, all Speaking items in a grade-level cluster are presented in one single table.

The first section of the Complete Item/Task Analysis and Summary table provides information about the total set of items or tasks and includes the item type (selected response or constructed response), the average item difficulty (in logits), the number of items, the average p value (for Listening and Reading only), the average infit mean square, and the average outfit mean square.

The second section of these tables presents results of the analyses of all of the items or tasks on the test form. The first column provides the unique item name. For Speaking only, the next two columns indicate (i) whether the item is found on the Tier A or Tier B/C test with an asterisk indicating shared tasks and (ii) the intended proficiency level of the task (1, 3, or 5). For all domains, the next column in this section presents the item difficulty in logits. The next column provides information on whether the item or task served as an anchor item or task. Note that for ACCESS Series 403 Paper, which is the same form as Series 401 for all domains, clusters, and tiers, no items served as anchors, as explained in Section 2.7. For dichotomously scored items (Listening and Reading), the next column shows the p value (percentage of correct answers on that item). The next two columns show the Rasch fit statistics for the item or task.

In addition, Writing and Speaking tables have a final section which provides raw score distributions by task.

2.2 DIF Analysis and Summary

Differential item function analyses (DIF) attempt to investigate whether performances on items are influenced by factors extraneous to English language proficiency (i.e., the construct being measured on the test). In other words, they attempt to find items that may be functioning differently for different groups based on criteria irrelevant to what is being tested. The performance of students on ACCESS for ELLs Paper items and tasks was compared by dividing students into two different groupings: first, males versus females; second, students of Hispanic ethnic background versus students of all other backgrounds. Students for whom gender or ethnicity¹ was unknown were excluded from both analyses. Two commonly used procedures for detecting DIF were used: one for dichotomously scored items (Listening and Reading) and one for polytomously scored items (Writing and Speaking).

Dichotomous Items

Following procedures that were originally proposed by the Educational Testing Service (ETS), the Mantel-Haenszel (M-H) chi-square statistic (Mantel & Haenszel, 1959) was used for dichotomous items. This procedure compares item-level performances of students in the two groups (e.g., males versus females) who are divided into subgroups based on their performance on the total test. It is assumed that, if there is no DIF, at any ability level (based on performance on the total test), a similar percentage of students in each group should get the item correct. The M-H chi-square statistic is used to check the probability that the two groups performed similarly on each item across the ability groupings. The statistic is transformed into the “M-H delta” scale. This scale is symmetrical around zero, with a delta zero interpreted as indicating that neither group is favored. A positive result indicates that one group is favored; a negative result indicates that the other group is favored.

Because DIF is measured on a continuous scale, and because most items are likely to show some degree of DIF, it is useful to have guidelines to determine when the level of DIF is worrying. We follow the guidance provided by ETS (Zieky, 1993) to classify items into DIF levels as follows:

- A (no DIF), when the absolute value of delta is <1.0
- B (weak DIF), when the absolute value of delta is 1.0 to 1.5
- C (strong DIF), when the absolute value of delta is >1.5

The software program *EZDIF* (Waller, n.d.) was used to run the DIF analyses for all forms containing dichotomous items. For each test form, the greatest number of ability-level groupings is used; however, for many test forms, students scoring some of the lowest and highest raw scores need to be grouped together in order to have enough cases in each cell for the statistic to be appropriately calculated. (Note that this software program uses a two-step purification

¹ In the dataset, Hispanic ethnicity, as well as each of the race categories, is coded as a binary variable (Y/blank). Ethnicity information is counted as “Unknown” in cases where the student is recorded as blank for Hispanic ethnicity and also blank for every race category.

process; that is, items with C-level DIF in the first pass are removed from the matching variable in the second stage, and the DIF is then recalculated for the remaining items.)

Polytomous Items

For polytomous items (i.e., Writing and Speaking tasks), a similar approach is used. It is based on the M-H chi-square statistic and the standardized mean difference following procedures again developed by ETS (Zwick, Donoghue, & Grima, 1993; Allen, Carlson, & Zalanak, 1999). The DIF procedures developed by ETS for polytomous items were used to identify tasks that exhibit DIF. JMetrik (Meyer, 2018), an open source computer program for psychometric analysis, was used in conducting the analyses. The procedures implemented in JMetrik first calculate the Cochran-Mantel-Haenszel chi-square statistic for testing statistical significance. This statistic gives an indication of the probability that observed differences are the result of chance but does not indicate how significant that difference is. To indicate how significant the difference is, the standardized mean difference between the performances of the two groups being compared is calculated. The standardized mean difference compares the means of the two groups, adjusting for differences in the distribution of the two groups being compared across the values of the total raw scores. To standardize the outcome, this difference is divided by the item score range and serves as an effect size measure for the Cochran-Mantel-Haenszel chi-square statistic. This effect size measure (reported as standardized P-DIF in JMetrik) ranges from -1 to 1, which may present some challenges when interpreting it. To mitigate this, the absolute value is taken in JMetrik (Meyer, 2018), thereby restricting the range of the rescaled effect size (standardized P-DIF*) to fall between 0 and 1. The effect size flagging criterion for polytomous items, proposed by ETS (Allen et al., 1999), is also rescaled to the standardized P-DIF* metric (Meyer, 2018).

Following guidance proposed by ETS for the National Assessment of Educational Progress (Allen et al., 1999), ACCESS for ELLs Writing and Speaking tasks are classified into three DIF levels as follows:

- AA (no DIF), when the Cochran-Mantel-Haenszel chi-square statistic is not significant or when it is significant and standardized P-DIF* is <0.05
- BB (weak DIF), when the Cochran-Mantel-Haenszel chi-square statistic is significant and standardized P-DIF* is ≥ 0.05 but <0.10
- CC (strong DIF), when the Cochran-Mantel-Haenszel chi-square statistic is significant and standardized P-DIF* is ≥ 0.10

The tables in this section provide a summary of the findings of the DIF analyses at the top, followed by information for any item or task which showed B, BB, C, or CC-level DIF. The first column gives the DIF level: A, B, or C for dichotomous items or AA, BB, or CC for polytomous tasks (i.e., Writing and Speaking tasks). The next columns show the contrasting groups in the DIF analyses: either male versus female or Hispanic versus non-Hispanic other ethnicities. The top part of the table summarizes the number of items which exhibit DIF falling into each of the three categories (A, B, or C for Listening and Reading, and AA, BB, or CC for Writing and

Speaking). Any items that show B (or BB) or C (or CC)–level DIF are reported in the bottom part of the table.

Paper ACCESS is administered as two rotating static forms. All items were screened for C-level DIF at the time the static Paper forms were selected; therefore, we do not conduct an annual review of items that might display C- or CC-level DIF. Any C- or CC-level DIF findings will be taken into account for any future Paper ACCESS test refreshment.

2.3 Raw Score Distribution

Figures and tables in this section provide detail on the distribution of raw scores. For each grade-level cluster and tier combination, the figure shows the distribution of the raw scores. The horizontal axis shows the raw scores. The vertical axis shows the number of students (count). Each bar shows how many students received each raw score.

Each table in this section summarizes results for a grade-level cluster and tier combination (e.g., Speaking 4–5 Tier A). For each table, results are broken down by grade and also presented for the grade-level cluster as a whole for that tier. The following information is included in each table:

- The number of students in the analyses (the number of students who were not absent, invalid, refused, exempt, or in the wrong grade-level cluster)
- The minimum observed raw score
- The maximum observed raw score
- The mean (average) raw score
- The standard deviation (std. dev.) of the raw scores

2.4 Scale Score Distribution

Figures and tables in this section relate to the ACCESS for ELLs scale scores on each test form. For each test form, raw scores were converted to vertically equated scale scores. Scale score distribution is presented by grade-level cluster and tier, and also by grade-level cluster, combining tiers.

For each test form, the figure shows the distribution of the scale scores. Scale scores are plotted on the horizontal axis, grouped into units of five scale score points (e.g., 100-104, 105-109, 110-114, etc.). The number of students with scale scores falling into each range is plotted on the vertical axis. ACCESS Paper is tiered; therefore, depending on the tiers the students were placed in, their possible scale scores will vary.

The tables in this section show, by grade and by total for the grade-level cluster:

- The number of students in the analyses (count)
- The minimum observed scale score
- The maximum observed scale score
- The mean (average) scale score
- The standard deviation (std. dev.) of the scale scores

In the tables and figures in this section, scale scores that were computed using mode-adjusted scoring tables are excluded from the analysis.

2.5 Proficiency Level Distribution

The figures and tables in this section provide information on the proficiency level distribution of the students who took the test form based on their performance. Proficiency level distribution is presented by grade-level cluster and tier, and then by grade-level cluster, combining tiers. In the figure, the horizontal axis shows the six WIDA proficiency levels. The vertical axis shows the percentage of students. Each bar shows the percentage of students who were placed into each proficiency level in the domain being tested on this test form.

In the tables presented in this section, each row shows, by grade and by total for the grade-level cluster:

- The WIDA proficiency level designation (1–6)
- The number of students (count) whose performance on the test form placed them into that proficiency level in the domain being tested
- The percentage of students, out of the total number of students taking the form, who were placed into that proficiency level in the domain being tested

Note that for Kindergarten and Tier A tests in some domains, it was not possible to place into all proficiency levels.

In the tables and figures in this section, proficiency levels computed using mode-adjusted scoring tables are excluded from the analysis.

2.6 Raw Score to Scale Score to Proficiency Level Conversion

This section presents raw score to scale score conversions and associated proficiency levels for each test form.

The first column shows all possible raw scores. The following column shows the corresponding scale score. The next column shows the conditional standard error of measurement (CSEM) in the metric of the scale score, multiplied by 1.96. This is the confidence band as reported on students' score reports. Following the CSEM, columns provide the proficiency level interpretation for each grade in the grade-level cluster.

Note that raw scores of zero are truncated where necessary so that the lowest scale score given is the scale score corresponding to a proficiency level score of 1.0.

2.6.1 Listening

2.6.1.0 Kindergarten

2.7 Equating and Recalibration Summary

All ACCESS Series 403 Paper test forms are static forms, and no annual equating analyses were conducted.

For technical details on the Kindergarten test, see MacGregor, Kenyon, Gibson, and Evans (2009).

For ACCESS Series 403 Grades 1-12, details on the static forms are provided below, for Listening and Reading Tier A (static forms that have been used in prior years), for Listening and Reading Tier BC (static forms newly constructed for Series 403), and then for Writing and Speaking (also static forms that have been used in prior years).

The ACCESS Series 403 Paper Listening Grades 1-12 Tier A forms are the same forms as those used in Series 402 Paper, Series 401 Paper, Series 400 Paper, and Series 303. The ACCESS Series 403 Paper Reading Grades 1-12 Tier A forms are the same forms as those used in Series 401 Paper and Series 303.

The ACCESS Series 403 Paper Listening and Reading Grades 1-12 Tier BC forms were newly constructed using Series 302 and Series 303 Tier B and Tier C item pools (see Part 1 Section 2.3).

The Series 302 and 303 ACCESS forms were operational in 2013–14 and 2014–15, which were the final 2 years prior to the launch of ACCESS Online. To mitigate concerns that there might be systematic differences between the population of students who took ACCESS 302 and 303 and the population of students who currently take Paper ACCESS, a series of recalibration studies were conducted using Series 400 and Series 401 Paper population data to refine Series 302 and Series 303 Listening and Reading item parameters.

Since Series 401 Paper, Series 400 Paper, and Series 303 Listening Grades 1-12 test forms are identical, and since the Series 401 Paper population is more current than the Series 400 Paper population, the item parameters for Series 303 Listening Grades 1-12 forms were refined using Series 401 Paper population data. In the recalibration analyses, the difficulty measures of Series 303 test items were initially anchored to their previously calibrated values from the Series 303 annual equating study. After the first calibration run, some items that were initially anchored proved to have changed in their difficulty measure. This change is measured by the “Displacement” statistic. This statistic shows the difference between the difficulty value of the anchored item and what the difficulty value would have been had it not been anchored. If this value was large (i.e., above 0.30 or below -0.30), that item was unanchored in the final calibration run (i.e., its parameter was re-estimated). For Series 403 Paper Reading Grades 1-12 forms, a similar process was used to refine Series 302 and Series 303 item parameters using Series 400 and 401 Paper student population data, respectively.

For Listening and Reading Tier A, these refined parameters were used with the intact Tier A forms from Series 303.

For Listening and Reading Tier BC, the refined parameters derived from the recalibration studies were used in conducting a form selection meeting and in constructing the Series 403 Paper Listening and Reading Grades 1-12 Tier BC forms.

The ACCESS Series 403 Paper Writing Grades 1-12 forms are the same forms as those used in Series 401, and the ACCESS Series 403 Paper Speaking forms are the same as those used in Series 401. Please see the Annual Technical Report for ACCESS for ELLs Paper Series 401 (Center for Applied Linguistics, 2018) for equating summaries for Writing and Speaking.

2.8 Test Characteristic Curve

Test characteristic curves graphically show the relationship between the ability measure (in logits) on the horizontal axis and the expected raw score on the vertical axis. Five vertical lines indicate the five cut scores for the highest grade in the grade-level cluster for the test form, dividing the figure into six sections for each of the WIDA proficiency levels (PLs 1–6) for the domain being tested. (Note that for Kindergarten and Tier A tests in some domains, it was not possible to place into all six proficiency levels.) As would be expected, higher raw scores are required for placement in higher proficiency levels. The relative width of each section between the cut score lines, however, gives an indication of how many items on that form must be answered correctly (for Listening or Reading) or how many points must be earned (for Writing or Speaking) to be placed into a WIDA proficiency level.

2.9 Test Information Function

With the Rasch measurement model, as with any measurement model following item response theory, the relationship between the ability measure (in logits) and the accuracy of test scores can be modeled. It is recognized that tests measure most accurately when the abilities of the examinees and the difficulty of the items are most appropriate for each other. If a test is too difficult for an examinee (i.e., the examinee scores close to zero), or if the test is too easy for an examinee (i.e., the examinee receives a perfect or near-perfect score), accurate measurement of the examinee's ability cannot be made. The figures in this section show graphically how well the test is measuring across the ability measure spectrum. High test information values indicate more accuracy in measurement. Figures show the relationship between the ability measure (in logits) on the horizontal axis and measurement accuracy, represented as the Fisher information value (which is the inverse squared of the standard error), on the vertical axis. The test information function, then, reflects the conditional standard errors of measurement.

Five vertical lines on the test information function figure indicate the five cut scores for the highest grade in the grade-level cluster for the test form, dividing the figure into six sections for each of the WIDA language proficiency levels (1–6) for the domain being tested. The ACCESS cut scores lines are presented along with the test information function to facilitate the interpretation of the test information curves. The test information curve and the corresponding ACCESS cut score lines are both expressed on the ACCESS logit scale. Note that for Kindergarten and Tier A tests in some domains, it was not possible to place into all six proficiency levels.

2.10 Reliability

Cronbach's coefficient alpha is widely used as an estimate of reliability, particularly of the internal consistency of test items. It expresses how well the items on a test appear to measure the same construct. Conceptually, it may be thought of as the correlation obtained between performances on two halves of the test, if every possibility of dividing the test items in two were attempted. Thus, Cronbach's alpha may be low if some items are measuring something other than what the majority of the items are measuring. As with any reliability index, it is affected by the number of test items (or test score points that may be awarded). That is, all things being equal, the greater the number of items, the higher the reliability.

Cronbach's alpha is also affected by the distribution of ability within the group of students tested. All things being equal, the greater the heterogeneity of abilities within the group of examinees (i.e., the more widely the scores are distributed), the higher the reliability. In this sense, Cronbach's alpha is *sample dependent*. It is widely recognized that reliability can be as much a function of the sample of students tested as of the test. That is, the same test can produce widely disparate reliability indices based on the ability distribution of the group of examinees. Because ACCESS Paper is a tiered test (that is, because each form in Tier A or BC targets only a certain range of the entire ability distribution), results for reliability on any one form, particularly for the shorter Listening test, may at times be lower than typically expected.

The formula for Cronbach's alpha is

$$\alpha = \frac{n}{n-1} \left[1 - \frac{\sum_{i=1}^n \sigma_i^2}{\sigma_t^2} \right]$$

where

n = number of items i

σ_i^2 = variance of score on item i

σ_t^2 = variance of total score

Tables in this section also present the SEM based on classical test theory. Unlike item response theory, in this approach, SEM is seen as a constant across the spread of test scores (ability continuum). Thus, it is not conditional on ability being measured. It is, however, a function of two statistics: the reliability of the test and the (observed) standard deviation of the test scores. It is calculated as

$$SEM = SD \sqrt{1 - \text{reliability}}$$

Traditionally, SEM has been used to create a band around an examinee's observed score, with the assertion in the view of classical test theory that the examinee's true score (i.e., what the

examinee’s score would be if it could be measured without error) would lie with a certain degree of probability within this band. Statistically speaking, then, there is an expectation that an examinee’s true score has a 68% probability of lying within the band extending from the observed score minus 1 SEM to the observed score plus 1 SEM.

Tables are provided below to express reliability for each domain. The first table for each domain provides Cronbach’s alpha and the SEM for all test takers. Each row in the table represents a test form, and values for the numbers of students, numbers of tasks, Cronbach’s alpha, and SEM are provided for each test form. The second table for each domain provides the same information for the population of female students and the population of male students. The third table provides information by ethnicity, for Hispanic and non-Hispanic test takers, and the fourth table provides information for the population of students who have an individualized education plan (IEP).

Note that for the Kindergarten test, a stratified Cronbach’s alpha is reported in order to take into consideration that the dichotomous and polytomous items have different true score variance.

2.11 Interrater Agreement

For the Writing tests (except Kindergarten, which is scored by the test administrator), tables provide information on interrater agreement for a sample of 20% of task raters. These tables show, for each of the tasks, the percentage of agreement between two raters. The first column shows the task, and the second column shows the number of responses that were double scored. DRC selects a sample of 20% of all responses scored, chosen at random during the operational scoring process. The next columns show the rates of agreement.

For Writing, with 0–6 as defined levels and the possibility of awarding a “plus” score between levels (e.g., 3, 3+, or 4 are all valid scores), scores that match or are contiguous (for example, if Rater 1 assigns a 3+ and Rater 2 assigns a score of 3, 3+, or 4) are categorized as agreement (% AG). Scores that are one whole score point apart (for example, if Rater 1 assigns a 3+ and Rater 2 assigns a score of 2+ or 4+) are categorized as adjacent (% AD). Otherwise, the raters are nonadjacent (% NA).

As the Speaking test is scored locally, it is not possible to provide interrater agreement data for Speaking. Section 3.2.3 in Part 1 of this report describes training procedures that local raters must complete before being certified to administer and score the Speaking test.

2.12 Conditional Standard Errors of Measurement at Cut Score

The tables in this section present information on the conditional standard errors of measurement (CSEM) at the most important points at which decisions are made about students based on performance on ACCESS—the cut points between language proficiency levels. Because the cut points depend on the grade level, information is provided for each grade level within a grade-level cluster.

For each domain, the values are presented by tier. From these tables, it is possible to identify how well the different tiers are targeted for making decisions about students at the various proficiency level cuts. For example, Tier A is intended for students at the lowest end of the language proficiency continuum. Optimally, Tier A forms should have the lowest CSEM of any tier at the 1/2 proficiency level cut, and a relatively low CSEM at the 2/3 proficiency level cut. At the other end of the continuum, Tier B/C forms should optimally have the lowest CSEM at the 5/6 proficiency level cut, and a relatively low CSEM at the 4/5 proficiency level cut. Information from these tables provides comparable information on how well the two tier forms are targeted to provide the most accurate measure in order to place their intended examinees into the language proficiency levels that they target.

In the tables below, the leftmost column shows the proficiency level cut (e.g., 1/2, which is the cut between PL 1 and PL 2). The second column shows the grade level. The third column shows the cut score in the scale score metric (e.g., 305). In the last column(s), the corresponding CSEM is given for each cut score in the scale score metric.

2.13 Accuracy and Consistency

One of the main purposes of the WIDA ACCESS program is to identify the English language proficiency level of students with respect to the WIDA ELD Standards. Because of the emphasis on the classification of student performance, a psychometric property of interest is how accurately and consistently ACCESS can classify students into WIDA proficiency categories. The analyses utilize the methods outlined by Livingston and Lewis (1995) and Young and Yoon (1998) as implemented in the software program BB-CLASS (Brennan, 2004; cf. also Lee, Hanson, & Brennan, 2002).

Classification accuracy is defined conceptually as the extent to which the proficiency classifications of students based on the assessment would agree with those made on the basis of their true scores. True scores are, of course, unknown. A common practice is to estimate the true scores based on observed scores and the parameters of the model used in estimating the true scores. Classification consistency is defined conceptually as the extent to which the proficiency classifications of students agree given two independent administrations of the same or two parallel test forms. However, it is impractical to obtain repeated administrations of the same or parallel test forms because of cost, testing burden, and effects of student memory and practice. A common approach is to estimate classification consistency from a single administration of a test.

Tables in this section present three pieces of information related to the accuracy and consistency of placement into the WIDA language proficiency levels for each domain. A separate table is provided for each grade in a grade-level cluster.

The first section provides overall indices related to the accuracy and consistency of classification, as well as Cohen's kappa. Overall accuracy indicates the percentage of all students who would be classified into the same language proficiency level by both the administered test and the true score distribution. For example, an overall accuracy of 0.774 means that an estimated 77% of students would be classified into the correct performance level according to observed and true scores. Overall consistency indicates the percentage of all students who would be classified into the same language proficiency level by both the administered test and by a parallel test. For example, an overall classification consistency of 0.664 means that an estimated 66% of students would be classified into the same performance level if two parallel forms were administered. Cohen's kappa assesses the proportion of consistency classifications after removing the proportion of consistent classifications that would be expected by chance. Due to this correction, Cohen's kappa values tend to be lower than overall consistency.

The second section of the table shows accuracy and consistency information conditional on proficiency level. The conditional accuracy indices examine the percentage of students classified by both tests into a proficiency level, divided by all students classified into that proficiency level according to the true score distribution. For example, an accuracy of 0.774 at PL 3 means that an estimated 77% of students are classified into PL 3 when their true scores suggest that they would be in PL 3. The conditional consistency indices examine the percentage of students classified by both tests into a proficiency level divided by all students classified into that proficiency level

according to a parallel test. For example, a classification consistency of 0.664 at PL 4 means that an estimated 66% of students would be classified into PL 4 when a parallel form suggests that these students would be classified in PL 4.

The third section of the table provides indices of classification accuracy, including the false-positives and the false-negatives, and consistency at the cut points. These indices are perhaps the most important of all when using any of these as an absolute cut point (e.g., determining which students have reached PL 5). For example, to evaluate the degree of confidence that one can have in a decision made based on the domain scores as to whether or not students are being accurately (consistently) classified into PL 5 (“Bridging”), one can look at the accuracy (consistency) index provided in the table for the cut score 4/5. Note that the accuracy and consistency are generally higher at the cut points than over the proficiency levels.

In terms of classifications around a single cut point, students can be misclassified in one of two ways. Students who were below the proficiency level cut score (based on their “true score”) but were classified based on the observed score as being above the cut score are considered to be false-positives. Students who were above the proficiency level cut score (based on their “true score”) but were classified as being below a cut score based on the observed score are considered to be false-negatives. All other students are considered to be accurately placed either above or below the cut score. The accuracy indices at the cut score examine the percentage of students who are accurately placed above and below the cut score.

The consistency indices at the cut examine the percentage of students classified consistently above and below the cut score.

In several cases no test takers were placed into the proficiency level, and accuracy and consistency of classification conditional on that level cannot be computed. Also, when the number of test takers placed into the proficiency level is smaller than 200, BB-CLASS produces estimates that are out of bounds (for example, a negative estimated percentage of students placed in the proficiency level). In these cases, ‘N/A’ has been placed in the table. In addition, there are a few cases where, due to the small percentage of test takers placed into the proficiency level and the range of observed scale scores, accuracy of classification conditional on that level cannot be estimated by BB-CLASS. In such cases, a hyphen (-) has been placed in the table.

The approach taken by Livingston and Lewis (1995) and implemented here uses information about the reliability of the test, the cut scores, and the observed distribution of scores. Then, using a four-parameter beta distribution, the distribution of the true scores and of scores on a parallel form is modeled. The Livingston and Lewis procedure requires that the reliability estimate of the test form be provided in estimating the classification consistency and accuracy statistics. Since ACCESS Paper tests were tiered, it was necessary to produce a single reliability estimate across tiers for the Livingston and Lewis procedure. This is a weighted reliability estimate across tiers (see Section 2.10).

	1/2	0.931	0.033	0.036	0.902
	2/3	0.910	0.043	0.046	0.875
	3/4	0.934	0.027	0.039	0.904
	4/5	0.971	0.020	0.009	0.954
	5/6	0.917	0.083	0.000	0.930

Note: Student scale scores and proficiency levels from the state of Colorado and Massachusetts are adjusted for mode effect prior to reporting. As these results are computed differently from other states' results, they are excluded from this analysis.

3 Analyses of Composite Scores

Four composite scores are calculated for ACCESS Online: Oral Language, Literacy, Comprehension, and Overall. Composite scores are calculated as weighted averages of domain scale scores, as follows:

- Oral Language: 50% Listening + 50% Speaking
- Literacy: 50% Reading + 50% Writing
- Comprehension: 30% Listening + 70% Reading
- Overall Composite: 15% Listening + 15% Speaking + 35% Reading + 35% Writing

This weighting resulted from a policy decision by the WIDA Board before the first operational administration of ACCESS, based on the view that literacy skills are paramount in developing academic language proficiency.

3.1 Scale Score Distribution for Composites

Figures and tables in this section provide scale score distributions for each of the composites, for each grade-level cluster.

For each cluster, the figure shows the distribution of the scale scores for the composite. Scale scores are plotted on the horizontal axis, grouped into units of five scale score points (e.g., 100-104, 105-109, 110-114, etc.). The number of students with scale scores falling into each range is plotted on the vertical axis.

Each table shows, by grade and by total for the grade-level cluster:

- The number of students in the analyses (count)
- The minimum observed scale score
- The maximum observed scale score
- The mean (average) scale score
- The standard deviation (std. dev.) of the scale scores

In the tables and figures in this section, scale scores which were computed using mode-adjusted scoring tables are excluded from the analysis.

3.1.1 Oral

3.1.1.0 Kindergarten

Table 3.1.1.0

Scale Score Descriptive Statistics: Oral K S403 Paper

Grade	No. of Students	Min.	Max.	Mean	Std. Dev.
K	232,462	100	378	272.03	81.50

3.1.1.1 Grade 1

Table 3.1.1.1

Scale Score Descriptive Statistics: Oral 1 S403 Paper

Grade	No. of Students	Min.	Max.	Mean	Std. Dev.
1	43,343	114	406	298.47	45.58

Note: Student scale scores and proficiency levels from the state of Colorado and Massachusetts are adjusted for mode effect prior to reporting. As these results are computed differently from other states' results, they are excluded from this analysis.

Note: Student scale scores and proficiency levels from the state of Colorado and Massachusetts are adjusted for mode effect prior to reporting. As these results are computed differently from the other states' results, they are excluded from this analysis.

3.1.1.2 Grade 2

Table 3.1.1.2

Scale Score Descriptive Statistics: Oral 2 S403 Paper

Grade	No. of Students	Min.	Max.	Mean	Std. Dev.
2	42,856	120	415	317.25	47.04

Note: Student scale scores and proficiency levels from the state of Colorado and Massachusetts are adjusted for mode effect prior to reporting. As these results are computed differently from other states' results, they are excluded from this analysis.

Note: Student scale scores and proficiency levels from the state of Colorado and Massachusetts are adjusted for mode effect prior to reporting. As these results are computed differently from the other states' results, they are excluded from this analysis.

3.1.1.3 Grade 3

Table 3.1.1.3

Scale Score Descriptive Statistics: Oral 3 S403 Paper

Grade	No. of Students	Min.	Max.	Mean	Std. Dev.
3	37,594	115	448	332.79	44.94

Note: Student scale scores and proficiency levels from the state of Colorado and Massachusetts are adjusted for mode effect prior to reporting. As these results are computed differently from other states' results, they are excluded from this analysis.

Note: Student scale scores and proficiency levels from the state of Colorado and Massachusetts are adjusted for mode effect prior to reporting. As these results are computed differently from the other states' results, they are excluded from this analysis.

3.1.1.4 Grades 4–5

Table 3.1.1.4

Scale Score Descriptive Statistics: Oral 4-5 S403 Paper

3.2 Proficiency Level Distribution for Composites

Figures and tables in this section provide information on the proficiency level distribution for each of the composites for each grade-level cluster.

In each figure, the horizontal axis shows the six WIDA proficiency levels. The vertical axis shows the percentage of students. Each bar shows the percentage of students who were placed into each proficiency level in the domain being tested on this test form.

The tables in this section present, by grade and by total for the grade-level cluster:

- The WIDA proficiency level designation (1–6)
- The number of students (count) whose performance on the test form placed them into that proficiency level in the domain being tested
- The percentage of students, out of the total number of students taking the form, who were placed into that proficiency level in the domain being tested

In the tables and figures in this section, scale scores which were computed using mode-adjusted scoring tables are excluded from the analysis.

3.3 Reliability

To estimate the score reliability of the composite scores, a stratified Cronbach's alpha coefficient (e.g., Rudner, 2001; Kamata, Turhan, & Darandari, 2003; Kane & Case, 2004) is computed, weighted by the contribution of each domain score into the composite. Specifically, the formula is

$$\alpha_c = 1 - \frac{\sum_{j=1}^k w_j^2 \sigma_j^2 (1 - \rho_j)}{\sigma_c^2}$$

where

k = number of components j

w_j = weight of component j

σ_j^2 = variance of component j

σ_c^2 = variance of composite

ρ_j = reliability coefficient of component j

Tables are provided below to express the stratified Cronbach's alpha for each of the composites. The first table for each composite provides stratified Cronbach's alpha for all test takers. The second table for each composite provides the same information for the population of female students and the population of male students. The third table provides information by ethnicity, for Hispanic and non-Hispanic test takers, and the fourth table provides information for the population of students who have an individualized education plan (IEP).

Each table is divided by grade-level cluster. Tables first include the input values used to compute Cronbach's alpha. The table lists the number of components for each composite and their weight. (See also the beginning of this chapter for an overview of how the composites are computed.)

For each grade-level cluster, a reliability coefficient is provided for each domain. To produce this coefficient, values for Cronbach's alpha for each of the tiers in the grade-level cluster (provided in Section 2.10) are weighted by the number of students who were administered the tier form, and a weighted average is expressed in the tables.

For each relevant domain component, the variance of the scale score is also provided. The variance of the composite scale score is also provided. The variances of domains and composites are computed for students who had valid results in all four domains.

Finally, the computed stratified Cronbach's alpha value for the composite is provided, by grade-level cluster.

The stratified Cronbach's alpha, presented in the tables in this section, was also used to produce the *Accuracy and Consistency* classification tables of the composites (Section 3.4).

3.4 Accuracy and Consistency of Composites

Tables below present three sections of information related to the accuracy and consistency of placement into the WIDA language proficiency levels for each composite score. The first section provides overall indices related to the accuracy and consistency of classification, as well as Cohen's kappa. The second section shows accuracy and consistency information conditional per proficiency level. The third section provides indices of classification accuracy, including the false-positives and false-negatives, and consistency at the cut points. These indices are perhaps the most important of all when using any of these as an absolute cut point (e.g., determining which students have reached PL 5). Note that the consistency is generally higher at the cut points than for the proficiency levels. For practical purposes, the primary score used for such decisions is the overall composite score.

As noted above in Section 2.13, there may be cases where the number of test takers placed into the proficiency level is fewer than 200 and accuracy and consistency of classification conditional on that level either cannot be computed or the software produces estimates that are out of bounds. In these cases, 'N/A' has been placed in the table. In addition, there may be cases where due to the small percentage of test takers placed into the proficiency level and the range of observed scale scores, accuracy of classification conditional on that level cannot be estimated by the software program that is used. In such cases, a hyphen (-) has been placed in the table.

3.4.1 Oral

Table 3.4.1.0

Accuracy and Consistency of Classification Indices: Oral (Grade K) S403 Paper

Overall Indices	Accuracy	Consistency		Kappa (k)	
		0.702	0.614		0.528
Conditional on Level	Level	Accuracy		Consistency

	5/6	N/A	N/A	N/A	N/A

Note: Student scale scores and proficiency levels from the state of Colorado and Massachusetts are adjusted for mode effect prior to reporting. As these results are computed differently from other states' results, they are excluded from this analysis.

3.5 Conditional Standard Error of Measurement for Composites

Conditional standard errors of measurement (CSEMs) for the four ACCESS composites provide test users a benchmark of how free the composite scale score is from measurement errors at the various point of the composites. Due to the differential weights applied to different ACCESS domains (see the introduction to this chapter for the weighting conventions), CSEM was estimated using a procedure based on item response theory (IRT) (Lord, 1980) and developed by Price et al. (2006). Price et al. (2006) extended the work by Lord (1980) and Kolen et al. (1992) in estimating the CSEM of a composite consisting of subtests. The basic premise of this procedure is that the student-level CSEM for a weighted composite can be estimated empirically using the IRT-based CSEM for each student on the subtests and the weights associated with the subtests. This method was used to estimate the CSEM for ACCESS composites by treating the ACCESS domains as subtests.

A three-step process was used in deriving the CSEM for ACCESS composites. The derivation was conducted by grade and composite to obtain a unique CSEM for each composite score by grade by composite. Since this procedure relies on empirical student data, which are subject to year-to-year fluctuation, all population student data from the previous ACCESS series were used in the derivation to obtain more stable estimates than using only data from a single series.

Step 1. Since ACCESS domains were calibrated separately, measurement errors associated with each of the ACCESS domains, as expressed in the CSEM, are independent of each other. Therefore, the CSEM for a student with composite score x , SEM_x , can be estimated using the equation derived by Price et al. (2006):

$$SEM_x = \sqrt{W_1^2 SEM_1^2 + W_2^2 SEM_2^2 + W_3^2 SEM_3^2 + \dots + W_k^2 SEM_k^2}$$

Where SEM_i^2 is the student's IRT-based score error variance or student's squared CSEM in ACCESS domain i and W_i is the weight applied to domain i , for $i=1, \dots, k$.

Step 2. Due to the differential weights applied to different ACCESS domains, two students with the same sum of weighted domain score, or composite, may obtain different CSEMs; therefore, an additional step was taken to obtain a unique value for each composite score. Specifically, the expected value of the CSEM functions for a composite score was estimated using a regression approach, and this expected value is used as the reported CSEM for that composite score.

Step 3. A linear smoothing procedure was applied to derive the CSEM for composite scores that were not observed in the data.

The figures in this section show graphically the CSEM for various composite scores by grade level. Figures show the relationship between the students' composite scores on the horizontal axis and conditional measurement errors on the vertical axis. Each point in the figures represents a student in the dataset, expressing both the student's CSEM and that student's scale score for the given composite score. Values for students who received the lowest possible scores on any

ACCESS domains are not plotted, as the conditional measurement errors for these students cannot be computed accurately. For grade-level clusters with multiple grades, different colors are used in the figures to represent students in different grades.

Five vertical lines in the figure indicate the five ACCESS cut scores for the highest grade in the grade-level cluster for the test form, dividing the figure into six sections for each of the WIDA proficiency levels (1–6) for the composites.

Low CSEM values indicate less measurement error or more accuracy in measurement. The general trend in these figures shows that the CSEMs are lower and fairly constant in the middle of the score range and higher and more variable for extreme low and high scores, as expected.

4. Annual Updates of Validity Evidence

According to the *Standards for Educational and Psychological Testing* (AERA, APA, NCME, 2014), validity is the degree to which all the accumulated evidence supports the intended interpretation of test scores for the proposed use.

Particular interpretations for specified uses begin by specifying the construct the test is intended to measure. Validity is the degree to which all the accumulated evidence supports the intended interpretation of the test scores for the proposed use. Rather than referring to distinct types of validity, the *Standards* refer to types of validity evidence.

According to the *Standards* the evidence can be based on 1) test content, 2) response processes, 3) internal structure, and 4) relations to other variables.

4.1. *Standards*

4.1.1. Test content

Important validity evidence can be obtained from an analysis of the relationship between the content of a test and the construct it is intended to measure. Test content refers to the themes, wording, and format of the items, tasks, or questions on a test. Administration and scoring may also be relevant to content-based evidence. Evidence based on test content can include logical or empirical analyses of the adequacy with which the test content represents the content domain and of the relevance of the content domain to the proposed interpretation of test scores. Evidence based on test content can also come from expert judgement of the relationship between parts of the test and content.

4.1.2. Response processes

Theoretical and empirical analyses of the response processes of test takers can provide evidence concerning the fit between the construct and the detailed nature of the performance or response actually engaged in by test takers. Evidence based on response processes generally comes from analysis of individual responses. Evidence of response processes can contribute to answering questions about differences in meaning or interpretation of test scores across relevant sub-groups of test takers. Studies of response processes are not limited to the test taker. Assessment often relies on observers or judges to record and/or evaluate test takers' performances or products.

4.1.3. Internal structure

Analyses of the internal structure of a test can indicate the degree to which the relationships among the test items and test components conform to the construct on which the proposed test score interpretations are based. The conceptual framework for a test may imply a single

dimension of behavior, or it may posit several components that are each expected to be homogeneous.

4.1.4. Relations to other structure

In many cases, the intended interpretation for a given use implies that the construct should be related to some other variables, and as a result, analysis of the relationship of the scores to variables external to the test provides another important source of validity evidence. Evidence about relations to other variables is also used to investigate questions of differential prediction for subgroups. In the test-criterion relationship the fundamental question is, how accurately do test scores predict criterion performance? Historically, two designs, often called predictive and concurrent, have been differentiated for evaluating test-criterion relationships. A predictive study indicates the strength of the relationship between test scores and criterion scores that are obtained at a later time. A concurrent study obtains test scores and criterion information at about the same time.

4.2. Annual validity studies

4.2.1. ACCESS for ELLs 2.0 Series 400 Construct Validity Study

Grant, R. & Kraninger, N. (2019). *ACCESS for ELLs 2.0 Construct Validation Study - ACCESS for ELLs 2.0, Series 400 with 2015-2016 Data*. WIDA Technical Report TR-2019-1 (unpublished).

A research study was conducted to examine the construct validity of the internal structures of the paper and online versions of ACCESS for the grade-level cluster forms within Grades 1-12 through construct validity techniques at the item level. The research questions were:

1. Are there 4 distinct, orthogonally related, first-order academic English language factors (Listening, Reading, Speaking, and Writing) underpinning English Learners' responses to Tiers A, B and C items within the grade-level cluster forms of the paper and online versions of the assessment?
2. If so, is there a 2nd-order, underlying factor (academic English language) orthogonally related to each first-order factor within each tier?

Confirmatory factor analyses were used to investigate the first research question and structural equation modeling techniques were used to investigate the second question. All 33 models had satisfactory model fit statistics. The conclusion was that the ACCESS for ELLs 2.0, Series 400 assessment (online and paper) has an internal structure consistent with four academic English language domains (Listening, Reading, Writing and Speaking) and a second order underlying language factor (academic English language). This suggests that it is appropriate to report separate English language domain scores and an overall composite score for the paper and online versions of the test.

4.2.2. WIDA Screener Online and WIDA ACCESS for ELLs: Examining the Relationship between Student Scores on Two Assessments

MacGregor, D., and Sahakyan, N. (in preparation). *WIDA Screener Online and WIDA ACCESS for ELLs: Examining the Relationship Between Student Scores on Two Assessments*. WIDA Technical Brief.

WIDA conducted a comparability study between WIDA Online Screener (hereafter Screener) and WIDA ACCESS (hereafter ACCESS). The purpose of the study was to understand to what extent scores on Screener predict scores on ACCESS, and how that relationship is potentially affected by several covariates, such as grade level, time between tests, and IEP status.

The results of this analysis show that Screener scores are highly correlated with and strongly predictive of ACCESS scores controlling for individual-level and institutional factors. Controlling for all of the above-mentioned factors, a one-point increase in the Screener Overall Composite Scale Score is associated with about a 0.70 point increase in the ACCESS Overall Composite Scale. Students with special needs score about 8 scale score points lower on ACCESS, compared to non-IEP students. Hispanic ELs score about 5 points below non-Hispanics, while female ELs score about 2.3 scale score points higher compared to their male counterparts. Finally, parameter estimates indicate that in addition to individual-level covariates, there are statistically significant grade, school, district and state effects; however, the predictive relationship between the two tests is not altered when these factors are accounted for.

These results provide evidence for the predictive validity of Screener for schools in the WIDA Consortium. The stable and strong predictive relationship between Screener and ACCESS Overall composite scores suggests that schools can confidently use the WIDA Screener Overall composite score when making placement decisions for ELLs. In addition, they provide validity evidence for the use of Screener as an identification tool for students in the WIDA Consortium.

4.2.3. 2018 ACCESS for ELLs 2.0 Speaking Study

Bishop, K., Read, S., Gocer-Sahin, S., and Akanda, M. (2019). *ACCESS for ELLs Speaking study*. WIDA Technical Report.

Although the amount of score difference varied year to year, in the domain of Speaking, paper scores have been consistently higher than online counterpart. The purpose of this study was to investigate potential differences in the test-taking and scoring procedures between the paper Speaking test and the online Speaking test. The results of this study are related to content validity since it explores possible reasons of differences among different administration and scoring procedures (AERA, APA & NCME, 2014) and evidence based on response processes.

In this study a WIDA researcher used the Speaking scores of ACCESS 401 population data. Data was collected from IL and FL. The WIDA researcher went to each school site to set up the

speaking test sessions and met teachers to administer and score the test. The student's entire testing session and spoken responses were audio recorded by the WIDA researcher.

A quantitative and qualitative analysis was conducted. As the first step of the quantitative analysis, descriptive statistics such as raw score distributions, means across states, tiers, and raters were calculated. Second, to explore the rater effects of test administrative modes, Patz's (1996) hierarchical rater model (HRM) for polytomous Speaking rating data scored by multiple raters to scale examinees and items was applied to model aspects of consensus among raters, and to model individual rater severity and consistency effects (Patz, Junker, Johnson, and Mariano, 2002).

Qualitative analysis was conducted in four steps.

- 1) Interviews: After the WIDA researcher recorded students' Paper speaking test responses, we interviewed paper raters for their reasoning of scores. For online raters, the interview questions were sent to them and after their scorings were done, they typed their answers to the survey questionnaire document.
- 2) Categorizing interviews and observations: Based on interviews and the observations from administering tests and testing environment, the researcher categorized the interview comments into themes.
- 3) FL score comparison: one WIDA researcher, a rater trainer in FL scored students' responses as she was observing the paper testing. The WIDA researcher's scores and FL local raters' scores and online raters' score in FL were compared.
- 4) Score difference examination: two WIDA researchers examined paper and online ratings where there were score differences for 50 tasks to explore possible reasons of score differences.

The quantitative analysis results, HRM results, showed us that online raters are more consistent in assigning the same score to work of the same quality than paper raters. Tier B/C is more difficult than Tier A. Interestingly, although number of ideal scoring is three for paper raters for tier A, it is six for tier B/C. Similar to paper raters, in tier A, number of ideal scoring of online raters is seven, however it is eight for tier B/C. Although there isn't much change for online raters, in general it can be said that when test becomes more difficult, raters become more reliable in scoring.

Based on the local observations and rater reliability results, the WIDA Researcher has identified a need for additional clarification of the various aspects of the Speaking domain that should be provided in local and online trainings. It can be said that there is no one reason to give a high or low score. However, WIDA Researcher observed that, word choice was overlooked as sophistication. Even if sophistication was not present in the answer, online raters scored 3. Even though one of three criteria was missing, both raters still gave score 3 no matter which criterion is missing.

It was also observed that sometimes teacher prompting occurred, but they were within legitimate promoting options according to test administrator manual. Occasionally some prompting was very guided and specific, but student answers did not get more sophisticated. Teacher-prompted answers did not always lead to higher scores by paper raters. Some paper raters paid more attention to criteria outside of the rubric such as “complete sentences” and scored lower. Interpretation of Nina model to the rubric description is an issue. For example, for P3 or P5 questions, Nina model answer has detailed explanations. It is not clear whether this explanation is referring to sophistication level in the rubric.
