### **Genetics Notes**

Who is Gregor Mendel? "Father of Genetics"

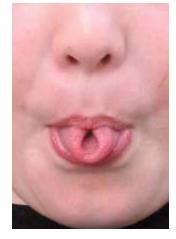

Principle of Independent Assortment – Inheritance of one trait has no effect on the inheritance of another trait

Man of Science Gregor Johann Mendel

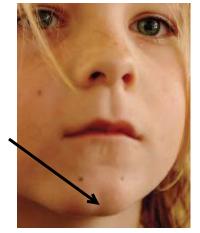

## Traits

 Genetics – study of how <u>traits</u> are passed from <u>parent</u> to <u>offspring</u>

 Traits are determined by the <u>genes</u> on the <u>chromosomes</u>. A gene is a segment of <u>DNA</u> that determines a <u>trait</u>.

Chromosomes come in <u>homologous</u> pairs, thus <u>genes</u> come in pairs.

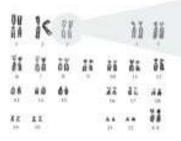

Homologous pairs – <u>matching</u> genes – one from female parent and one from male parent

Homologous regions code

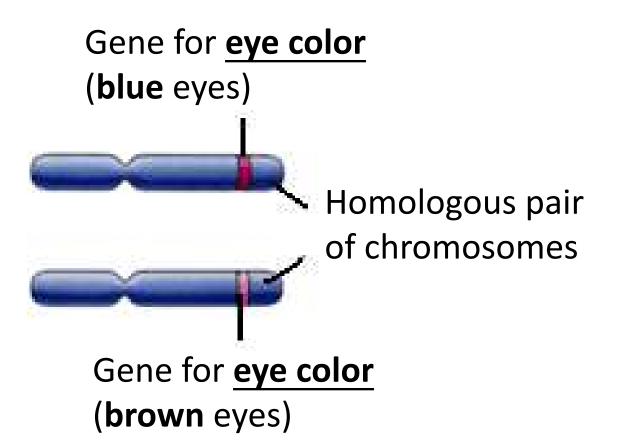

for the same gene.

Example: Humans have 46 chromosomes or <u>23</u> pairs.
 One set from dad – 23 in <u>sperm</u>
 One set from mom – 23 in <u>egg</u>

Homologous chromosomes contain DNA that codes for the same genes. In this example, both chromosomes have all the same genes in the same locations (represented with colored strips), but different 'versions' of those genes (represented by the different shades of each color).

Sister chromatids are exact replicas... ----but homologous chromosomes are not. -- • One pair of Homologous Chromosomes:

<u>Alleles</u> – different <u>genes</u> (possibilities) for the same <u>trait</u> – ex: blue eyes or brown eyes

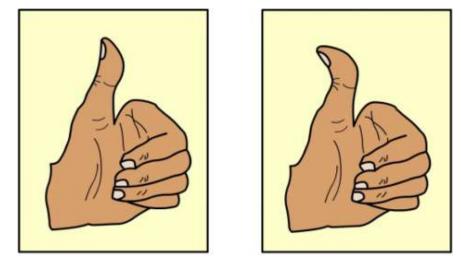

# **Dominant and Recessive Genes**

- Gene that prevents the other gene from "showing" dominant
- Gene that <u>does NOT</u> "show" even though it is <u>present</u> <u>recessive</u>
- Symbol Dominant gene <u>upper</u> case letter <u>T</u> Recessive gene – <u>lower</u> case letter – <u>t</u>

Example: Straight thumb is <u>dominant</u> to hitchhiker thumb  $\underline{T}$  = straight thumb  $\underline{t}$  = hitchhikers thumb

(Always use the same letter for the same alleles  $\underline{No} S = straight, h = hitchhiker's$ )

Straight thumb = TT Straight thumb = Tt Hitchhikers thumb = tt

\* Must have <u>2</u> recessive <u>alleles</u> for a recessive trait to "<u>show</u>"

- Both genes of a pair are the same <u>homozygous</u> or <u>purebred</u> TT – homozygous <u>dominant</u> tt – homozygous recessive
- One dominant and one recessive gene <u>heterozygous</u> or <u>hybrid</u>
  - Tt heterozygous

BB – Black Bb – Black w/ white gene

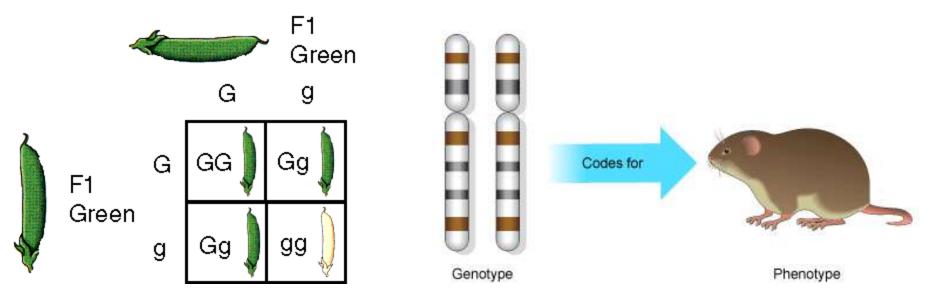

bb – White

# **Genotype and Phenotype**

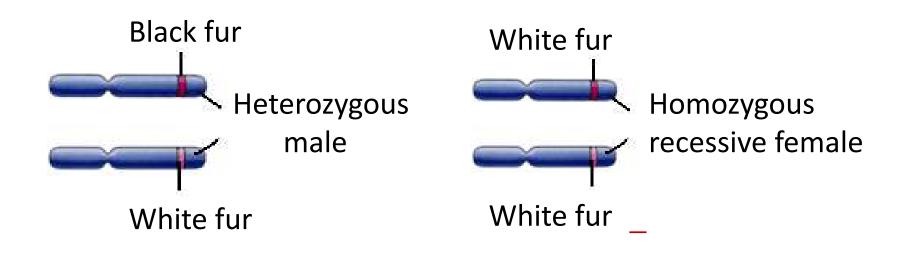

- Combination of genes an organism has (<u>actual gene</u> <u>makeup</u>) – <u>genotype</u> Ex: TT, Tt, tt
- Physical appearance resulting from gene make-up phenotype

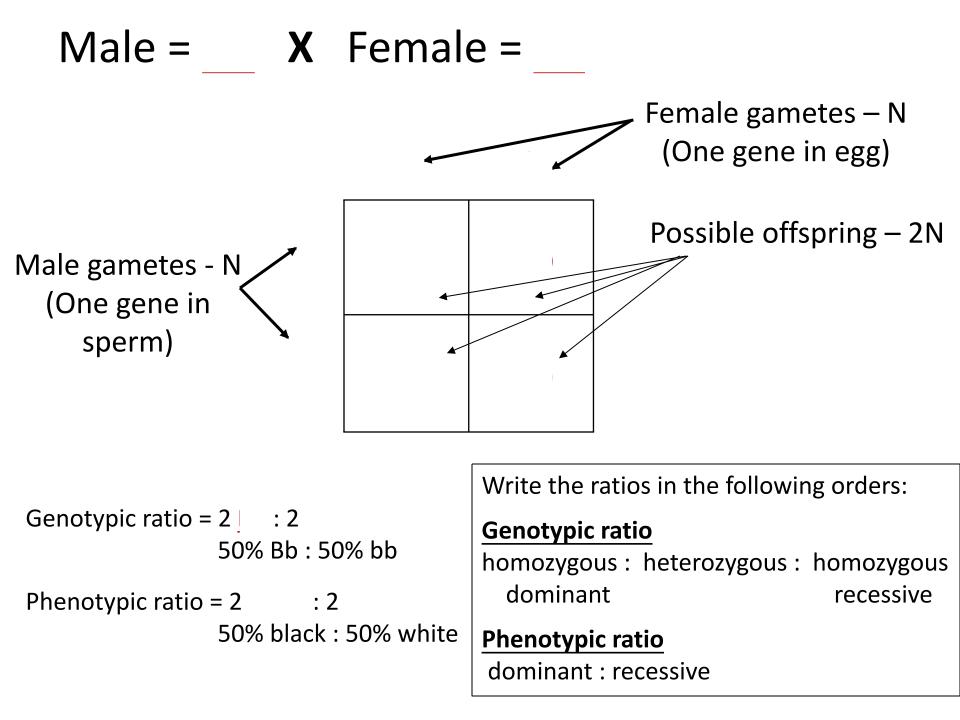

Ex: hitchhiker's thumb or straight thumb

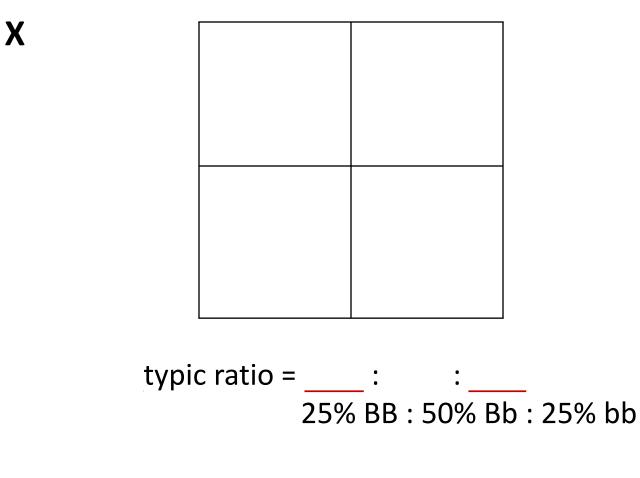

# **Punnett Square and Probability**

- Used to predict the possible gene makeup of offspring –
  Punnett Square
- Example: Black fur (B) is dominant to white fur (b) in mice
  - 1. Cross a <u>heterozygous</u> male with a <u>homozygous recessive</u> female.

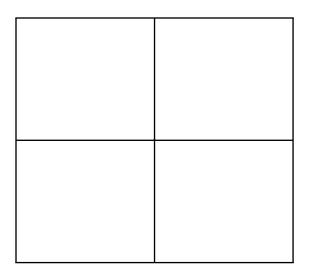

Cross 2 <u>hybrid</u> mice and give the genotypic ratio and phenotypic ratio.

Example: A man and woman, both with brown eyes (B) marry and have a blue eyed (b) child. What are the genotypes of the man, woman and child?

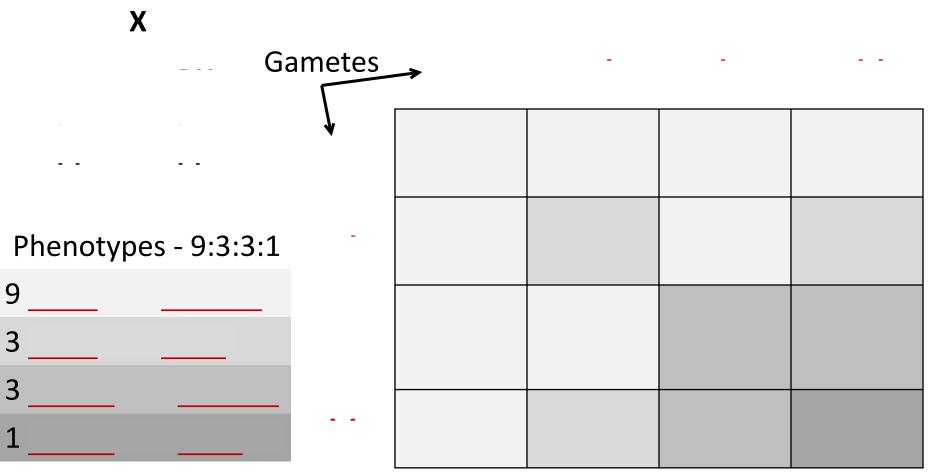

X Man = \_\_\_\_ Woman =

#### **Crossing involving 2 traits – Dihybrid crosses**

• Example: In rabbits black coat (B) is dominant over brown (b) and straight hair (H) is dominant to curly (h). Cross <u>2 hybrid rabbits</u> and give the phenotypic ratio for the first generation of offspring.

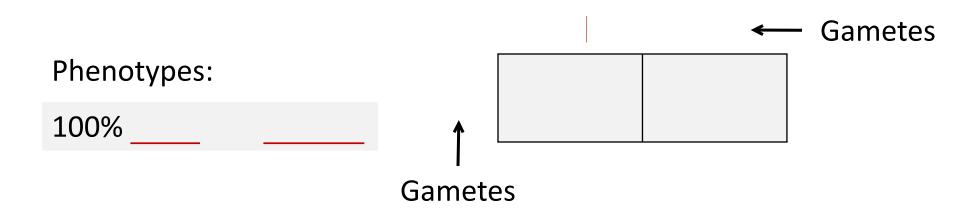

Possible gametes:

 Example: In rabbits black coat (B) is dominant over brown (b) and straight hair (H) is dominant to curly (h). Cross a rabbit that is homozygous dominant for both traits with a rabbit that is homozygous dominant for black coat and heterozygous for straight hair. Then give the phenotypic ratio for the first generation of offspring.

X

Possible gametes:

(Hint: Only design Punnett squares to suit the number of possible gametes.)

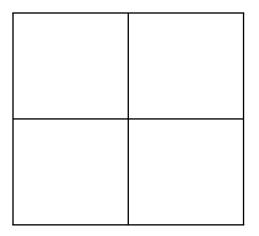

#### **Sex Determination**

- People <u>46</u> chromosomes or <u>23</u> pairs
- 22 pairs are <u>homologous</u> (look alike) called <u>autosomes</u> determine body traits
   1 pair is the <u>sex</u> chromosomes – determines sex (male or female)
- Females sex chromosomes are <u>homologous</u> (look alike) label <u>XX</u> Males – sex chromosomes are different – label <u>XY</u>

male	female											
<b>39</b>	2	82	<b>ŠŠ</b> 4	5		2	<b>XX</b> 3	<b>88</b> 4	<b>ăă</b> 5			
<b>80</b> 6	<b>88</b> 7	<b>36</b> 8	<b>ññ</b> 9	<b>88</b> 10	<b>8</b> K 6	<mark>ሽሽ</mark> 7	<b>XÄ</b> 8	<b>XX</b> 9	<b>ÄÄ</b> 10			
88	ก้อ้	80		dă	äx	ត័ភ	ää	ğă	ňň			
11	12	13	14	15	11	12	13	14	15			
**	**	ăă	**	**	**	*	<b>6</b> 8	**	XX			
16	17	18	19	20	16	17	18	19	20			
XX	**	6 m			XX	K K	ä	X				
21	22	XY	1		21	22		x				

• What is the probability of a couple having a boy? Or a girl?

Chance of having female baby? male baby?

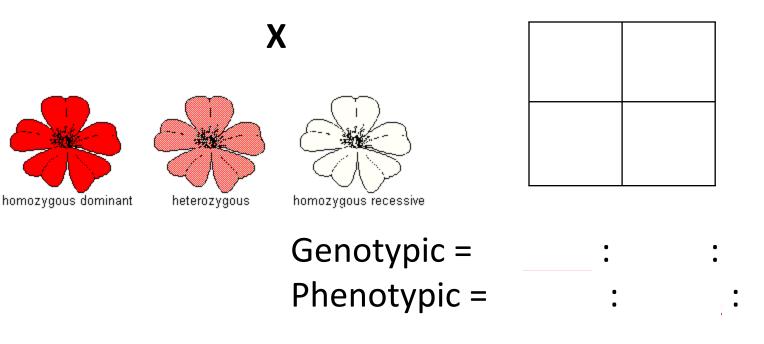

Who determines the sex of the child?

#### **Incomplete dominance and Codominance**

 When one allele is NOT completely <u>dominant</u> over another (they <u>blend</u>) – <u>incomplete dominance</u>

**Example:** In carnations the color red (R) is incompletely dominant over white (W). The <u>hybrid</u> color is <u>pink</u>. Give the genotypic and phenotypic ratio from a cross between <u>2 pink flowers</u>.

• When **both** alleles are **expressed** – **Codominance** 

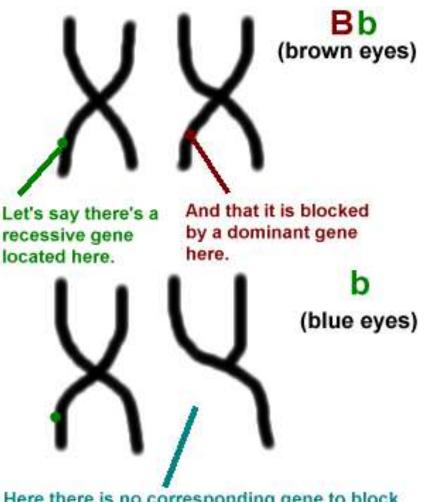

Example: In certain chickens black feathers are codominant with white feathers.

Heterozygous chickens have black and white speckled feathers.

#### Sex – linked Traits

- <u>Genes</u> for these <u>traits</u> are located <u>only</u> on the <u>X</u> chromosome (NOT on the Y chromosome)
- X linked alleles <u>always</u> show up in <u>males</u> whether <u>dominant</u> or <u>recessive</u> because males have only <u>one</u> X chromosome

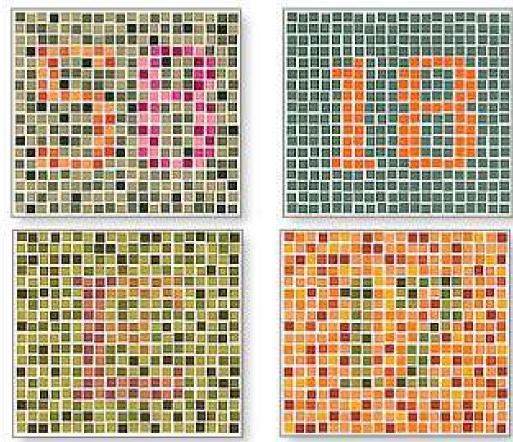

Here there is no corresponding gene to block the first. This recessive gene is displayed even though there is only one.

• Examples of <u>recessive</u> sex-linked disorders:

# **<u>1. colorblindness</u>** – inability to distinguish between

#### certain colors

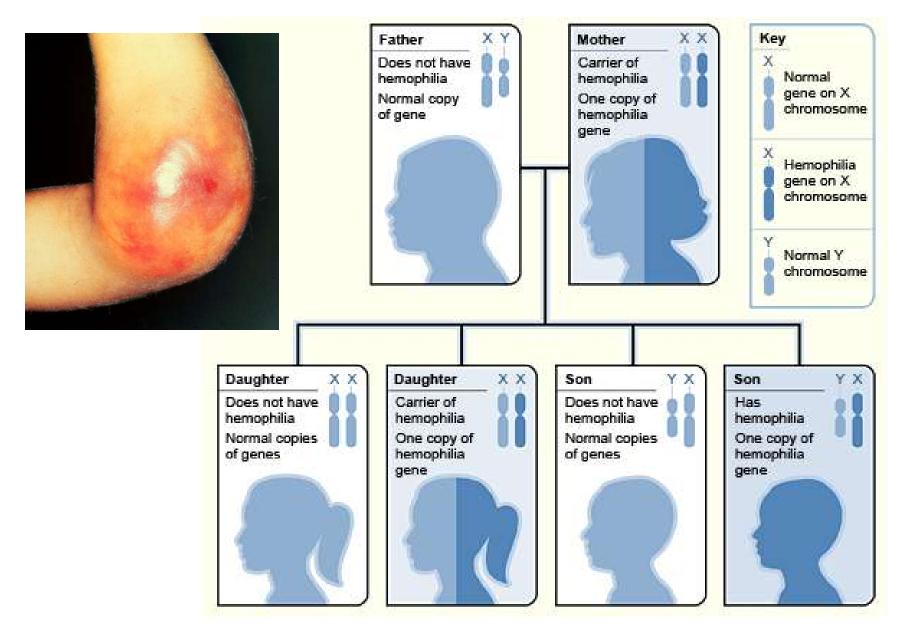

You should see **58** (upper left), **18** (upper right), **E** (lower left) and **17** (lower right).

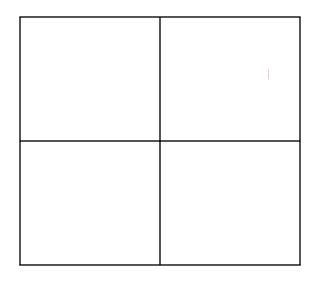

Various tests for color blindness

Color blindness is the inability to distinguish the differences between certain colors. The most common type is red-green color blindness, where red and green are seen as the same color.

## 2. <u>hemophilia</u> – blood won't clot

Example: A female that has normal vision but is a <u>carrier</u> for colorblindness marries a male with <u>normal vision</u>. Give the expected phenotypes of their children.
 N = normal vision
 n = colorblindness
 X

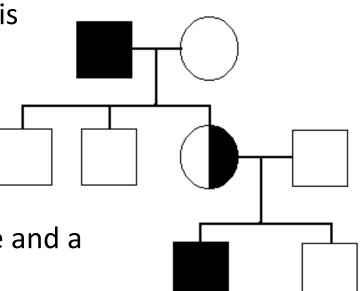

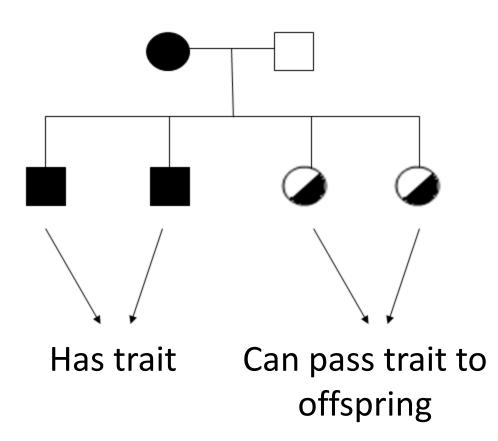

#### Phenotype:

#### Pedigrees

- <u>Graphic</u> representation of how a <u>trait</u> is passed from parents to <u>offspring</u>
- Tips for making a pedigree
  - 1. Circles are for females
  - **2.** Squares are for males
  - Horizontal lines connecting a male and a female represent a marriage
  - 4. Vertical line and brackets connect parent to offspring
  - A <u>shaded</u> circle or square indicates a person <u>has</u> the trait
  - 6. A circle or square **NOT shaded** represents an individual who does NOT have the trait
  - 7. Partial shade indicates a <u>carrier</u> someone who is <u>heterozygous</u> for the trait

Example: Make a pedigree chart for the following couple. Dana is <u>color blind</u>; her husband Jeff is not. They have <u>two boys</u> and <u>two girls</u>.
 HINT: Colorblindness is a recessive sex-linked trait.

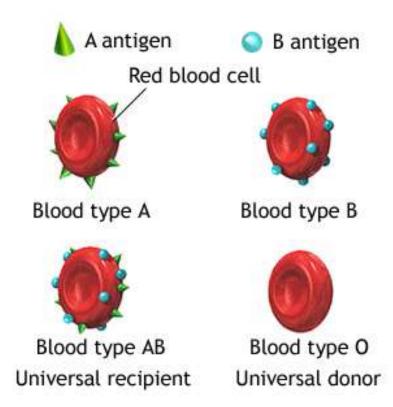

#### **Multiple Alleles**

- **<u>3 or more alleles</u>** of the <u>same</u> gene that code for a <u>single</u> trait
- In humans, <u>blood type</u> is determined by 3 alleles <u>A</u>, <u>B</u>, and <u>O</u>
  BUT each human can only inherit 2 alleles
  - 1. Dominant A and B (codominance)

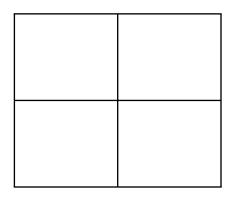

Recessive – O

2. Blood type – A = AA or AO B = BB or BO AB = ABO = OO

Example: What would be the possible blood types of children born to a female with type AB blood and a male with type O blood?

X

Children would be type or only

### Mutations

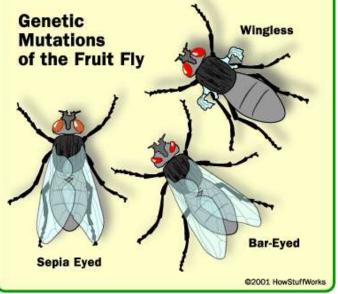

- Mutation sudden <u>genetic change</u> (change in <u>base</u> pair sequence of <u>DNA</u>)
- Can be :

Harmful mutations – organism less able to survive: genetic disorders, cancer, death

Beneficial mutations – allows organism to better survive: provides genetic variation

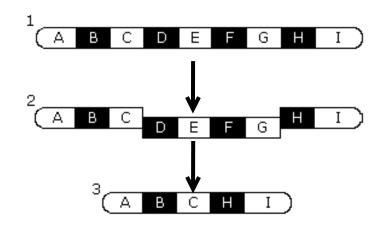

Neutral mutations – <u>neither</u> harmful nor helpful to organism

 Mutations can occur in 2 ways: <u>chromosomal</u> mutation or <u>gene/point</u> mutation

#### **Chromosomal mutation:**

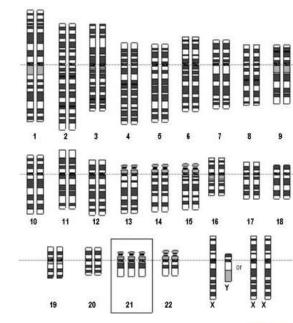

- less common than a gene mutation
- more <u>drastic</u> affects entire <u>chromosome</u>, so affects <u>many genes</u> rather than just one
- caused by failure of the <u>homologous</u> chromosomes to <u>separate</u> normally during <u>meiosis</u>
- chromosome pairs no longer look the same too few or too many genes, different shape

• Examples:

# **Down's** syndrome – (Trisomy 21) <u>47</u> chromosomes, extra chromosome at pair <u>#21</u>

flattened nose and face, upward slanting eyes,

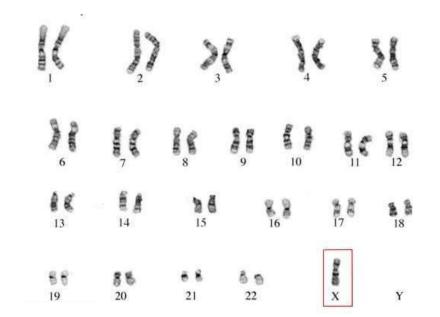

widely separated first and second toes and increased skin creases

# Turner's syndrome – only <u>45</u> chromosomes, missing a <u>sex</u> chromosome (X)

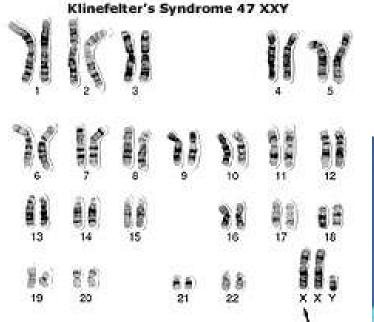

**<u>Girls</u>** affected – short, slow growth, heart problems

<u>Klinefelter's</u> syndrome – <u>47</u> chromosomes, <u>extra X</u> chromosomes (XXY)

**Boys** affected – low testosterone levels, underdeveloped muscles, sparse facial hair

 Having an <u>extra set</u> of chromosomes is <u>fatal</u> in <u>animals</u>, but in <u>plants</u> it makes them <u>larger</u> and <u>hardier</u>.

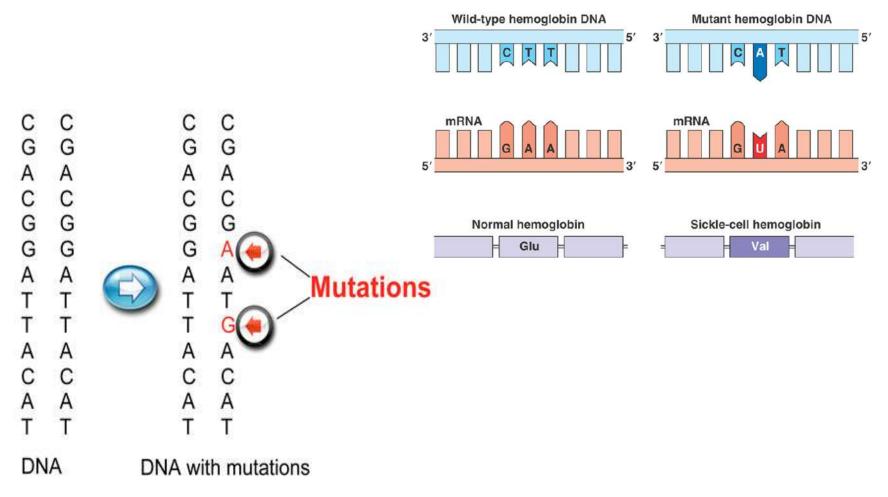

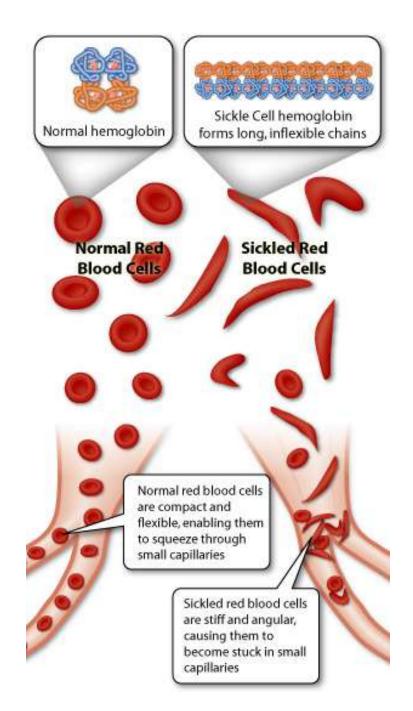

#### **Gene or Point Mutation**

- most common and least drastic
- only <u>one gene</u> is altered

• Examples:

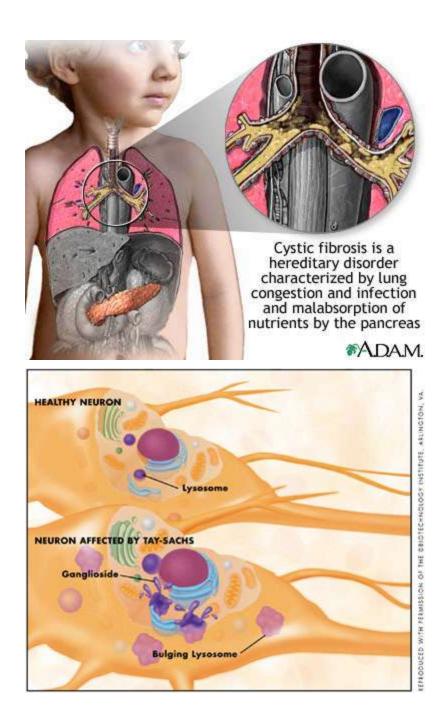

#### **Recessive gene mutations:** Sickle cell anemia – red blood cells are sickle shaped instead of round and cannot carry enough oxygen to the body tissues - heterozygous condition protects people from malaria

# <u>Cystic fibrosis</u> – <u>mucous</u> builds up in the <u>lungs</u>

#### Tay-Sachs Disease – deterioration of the <u>nervous system</u> – early death

Mutated genes produce enzymes that are less effective than normal at breaking down fatty cell products known as gangliosides. As a result, gangliosides build up in the lysosomes and overload cells. Their buildup ultimately causes damage to nerve cells.

Phenylketonuria (PKU) – an <u>amino</u> acid common in <u>milk</u> cannot be broken down and as it builds up it causes <u>mental retardation</u> – newborns are tested for this

Dominant gene mutations: <u>Huntington's disease</u> – gradual <u>deterioration</u> of <u>brain tissue</u>, shows up in <u>middle age</u> and is <u>fatal</u>

**Dwarfism** – variety of skeletal abnormalities

#### **Detecting Genetic Disorders**

- picture of an individual's chromosomes <u>karyotype</u>
- amniotic fluid surrounding the embryo is removed for analysis – <u>amniocentesis</u>
