*"Spring has sprung in Lahaina and we have started an end-of-year event. Last week, the Lahaina Schools Student Showcase provided an opportunity for the community to gather around young leaders and hear their visions for the future. I was inspired as my students presented their TED-Ed Student Talks about the Lahaina Renaissance and high school students spoke truth to power. This truly represented IMUA and PONO. ❤️"* - Ms. Penn

## Teen Health Matters!

Hawai'i schools are providing a new community mental health resource, as an addition to our school-based supports. Click [here](#) for more information.

**ParentTeen Connect:** is a free resource for parents that provides expert advice and practical tools for dealing with real parent-teen issues. [ParentTeenConnect.org](http://ParentTeenConnect.org) interviewed parents and teens from across the country about the issues that cause conflict in their lives, including screen time, independence, responsibility, and communication. Parenting expert Dr. Laura Kastner gives [advice on how to tackle these issues](#). Using these interviews and Dr. Kastner's expertise, we created a website especially for teens and their caregivers, where they can hear from real families, get expert advice, and learn about practical tools to help them connect and communicate with each other.

**Hearing Loss and What Causes It**

A number of different things can lead to hearing loss. The most common condition causing hearing loss is called presbycusis, a gradual, age-related reduction in the ability to hear high-pitched sounds. The second most common condition, noise-induced hearing loss, is caused by one-time exposure to extremely loud sounds, or by exposure to sounds at high levels for several years.

Hearing loss caused by noise can occur at any age. It may develop suddenly or gradually, depending on the source and intensity of the noise. Noise can affect hearing in several ways.

**Acoustic trauma** occurs when a sudden, extremely loud sound, such as an explosion, a gunshot, or a firecracker occurs close to the ear. This type of injury produces instant, and sometimes permanent hearing loss.

**Temporary threshold shift** occurs when loud sounds (such as from a rock concert) cause a temporary ringing and/or muffled hearing. These effects usually don't last more than a few hours, although they may sometimes last several days or weeks. Repeated exposure to sounds that cause temporary threshold shifts can gradually lead to permanent noise-induced hearing loss.

**Noise-induced hearing loss** is the result of repeated, frequent exposure to loud or extremely loud sounds over a long period of time. For example, listening to pop music at 110 to 120 dB.

**SAY WHAT? Hearing Loss Prevention**

The safest way to protect hearing is to wear earplugs when around loud noises. Earplugs lower the volume level, but they won't eliminate the sound. There are several types that lower the sound enough to be safe but allow speech to be heard at a comfortable level.

There are hundreds of types of earplugs and ear caps. Some earplugs are pre-molded and others can be molded to fit the ear. Some fit over the ear, while others are small ear caps. Different kinds of headphones and different types of ear caps offer different levels of protection, and different types of ear caps. The time it takes to adjust to wearing hearing protection is no different than the time it takes to get used to wearing other safety equipment.

Prevent noise-induced hearing loss by always wearing earplugs when around loud noises. The louder the noise level and the longer the exposure, the greater the risk of hearing loss.

**Remember once hearing loss occurs it is permanent and irreversible.**

**BE AWARE! PROTECT YOUR HEARING!**

**How loud is too loud?**

Hearing loss is caused by both the level of the noise and the duration of the exposure. Sound is measured in decibels (dB). A normal conversation takes place at 60 dB. Prolonged or repeated exposure to noise above 85 dB can cause hearing loss. The average level of noise in a workplace over an eight-hour period is 85 dB or higher, there is a risk of hearing loss. Chainsaws, lawnmowers and ballistics stop at over 100 dB.

Noise-induced hearing loss is usually permanent and cannot be reversed. Risk progresses and noise-induced hearing loss results in what is called sensorineural hearing loss, which occurs when the delicate hair cells in the inner ear that transmit sound become damaged. Some types of damage are reversible, but with repeated exposure to noise, most hair cells are damaged resulting in hearing loss. Hair cells do not grow back once they are damaged.

The loudness of a sound is measured in units called decibels (dB). Loud noises over 85 dB can damage the inner ear hair cells permanently.
