

# Physical Science Unit 1 Crash Course

Chapter 11, 12, and 14  
(Motion, Forces, and Machines)

# Chapter 11 - Motion

- ▶ Distance is the length of a path between two points.
- ▶ Displacement is the direction from the starting point and the length of a straight line from the starting point to the ending point.
- ▶ When two displacements, represented by two vectors, have the same direction, you can add their magnitudes.
- ▶ If two displacements have opposite directions, the magnitudes subtract from each other.

$$\begin{array}{l} \xrightarrow{5} + \xrightarrow{5} = \xrightarrow{10} \\ \xrightarrow{5} + \xleftarrow{5} = 0 \\ \xrightarrow{5} + \xrightarrow{10} = \xrightarrow{15} \\ \xrightarrow{5} + \xleftarrow{10} = \xleftarrow{5} \\ \xrightarrow{5} + \xleftarrow{15} = \xleftarrow{10} \\ \uparrow 10 + \downarrow 5 = \uparrow 5 \end{array}$$

# Chapter 11 - Motion

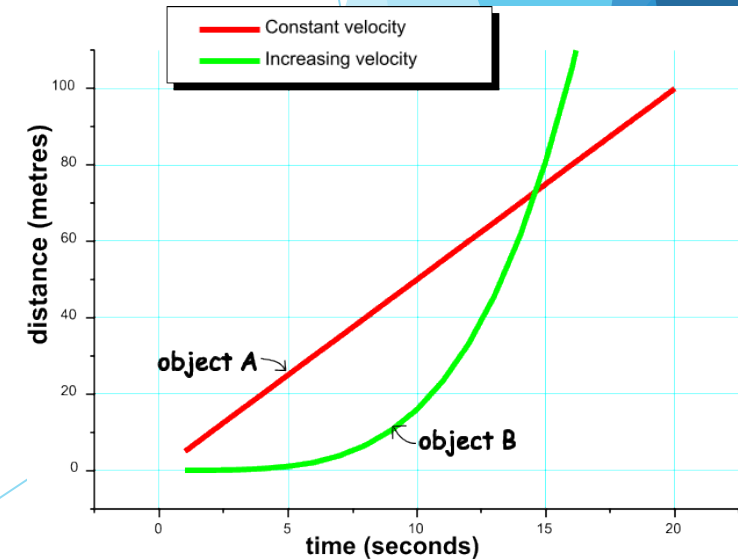

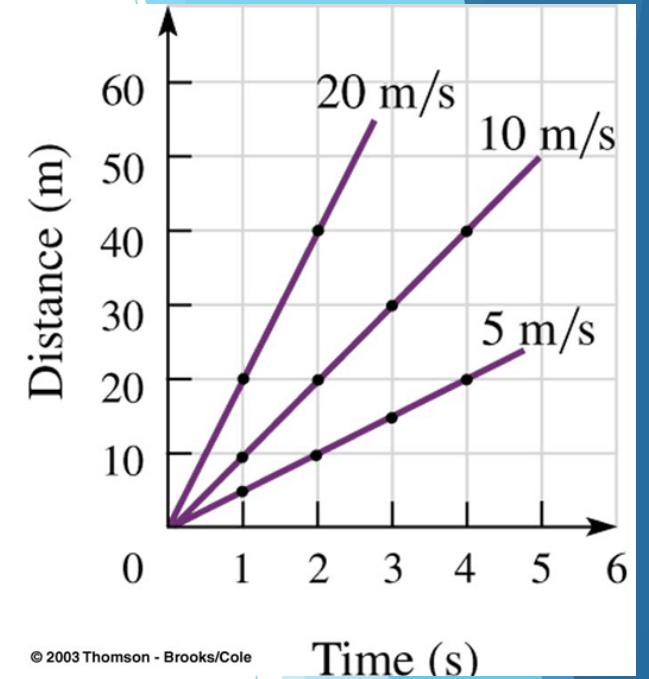

- ▶ Speed is the ratio of the distance an object moves to the amount of time the object moves.
- ▶ Velocity is a description of both speed and direction. Velocity is a vector.
- ▶ A change in velocity can be a result of a change in speed, direction, or both.

$$\text{Velocity} = \frac{\text{distance}}{\text{time}}$$

- ▶ The SI unit of speed and velocity is meters per second (m/s).

# Chapter 11 - Motion

- ▶ The slope of a line on a distance-time graph is speed.
- ▶ The steeper the slope of the line, the faster the speed.
- ▶ Straight lines represent constant speed.

# Chapter 11 - Motion

- ▶ The rate at which velocity changes is called acceleration.
- ▶ Acceleration can be described as changes in speed, changes in direction, or changes in both.
- ▶ Free fall is the movement of an object toward the Earth solely because of gravity.
- ▶ Objects falling near Earth's surface accelerate downward at a rate of  $9.8\text{m/s}^2$ .

# Chapter 11 - Motion

- ▶ The SI unit for acceleration is  $\text{m/s}^2$ .

$$a = \frac{v_f - v_i}{t}$$

- ▶ The slope of a speed-time graph is acceleration.
- ▶ Constant acceleration is represented by a straight line.
- ▶ On a distance-time graph, acceleration is represented by a curved line.

# Chapter 12 - Forces

- ▶ A force is a push or pull that acts on an object.
- ▶ A force can cause a resting object to move, or can accelerate a moving object by changing the object's speed or direction.

▶ Force is measured in newtons (N).  $\xrightarrow{10\text{ N}} + \xrightarrow{10\text{ N}} = \xrightarrow{20\text{ N}}$

▶ Forces combine by vector addition.

▶ When the forces on an object are balanced, the net force is zero and there is no change in the object's motion.

▶ An unbalanced force is a force that results when the net force acting on an object is not equal to zero.

$$\xrightarrow{10\text{ N}} + \xleftarrow{10\text{ N}} = 0\text{ N}$$

# Chapter 12 - Forces

- ▶ All moving objects are subject to friction, a force that opposes the motion of objects that touch as they move past each other.
- ▶ Static friction is the friction force that acts on objects that are not moving.
- ▶ Sliding friction is a force that opposes the direction of motion of an object as it slides over a surface.
- ▶ The change in shape when something rolls is the cause of rolling friction, the friction force that acts on rolling objects.
- ▶ The force of fluid friction opposes the motion of an object through a fluid.
- ▶ Fluid friction acting on an object moving through air is known as air resistance.

# Chapter 12 - Forces

- ▶ Gravity is an attractive force that acts between any two masses.
- ▶ Gravity does not require objects to be in contact for it to act on them.
- ▶ As the speed of a falling object increases, so does the air resistance.

# Chapter 12 - Forces

- ▶ According to Newton's first law of motion, the state of motion of an object does not change as long as the net force acting on the object is zero.
- ▶ Inertia is the tendency of an object to resist change in its motion.
- ▶ According to Newton's second law of motion, the acceleration of an object is equal to the net force acting on it divided by the object's mass.

$$a = F/m$$

- ▶ According to Newton's third law of motion, for every force there is an equal and opposite force.

# Chapter 12 - Forces

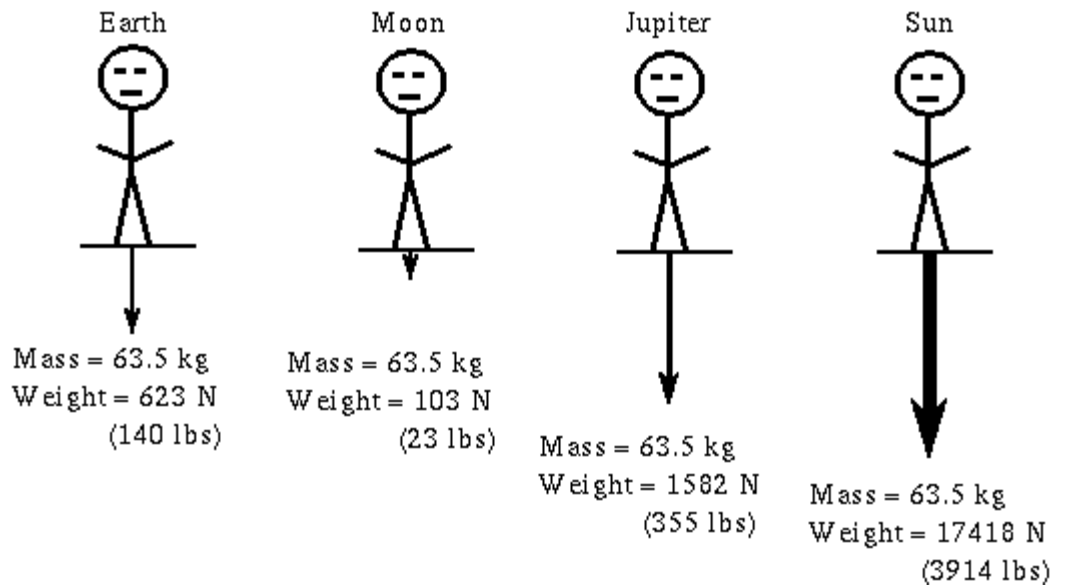

- ▶ Mass is the amount of matter an object contains.
- ▶ Weight is the force of gravity acting on an object.

$$W = m \times g$$

Weight (W) = N

mass (m) = kg

gravity (g) =  $9.8 \text{ m/s}^2$

# Chapter 12 - Forces

- ▶ All the universal forces act over a distance between particles of matter, which means that the particles do not need to be in contact with one another.
- ▶ Electromagnetic force is associated with charged particles.
- ▶ Two forces, the strong nuclear and the weak nuclear force, act within the nucleus to hold it together.
- ▶ Gravitational force is an attractive force that acts between any two masses.
- ▶ Newton's law of universal gravitation states that every object in the universe attracts every other object.

# Chapter 12 - Forces

- ▶ Newton's law of universal gravitation states that every object in the universe attracts every other object.
- ▶ The gravitational force between two objects is proportional to their masses and decreases as the distance between them increases.
- ▶ Gravity is the weakest universal force, but it is the most effective over long distances.

# Chapter 14 - Machines

- ▶ In science, work is the product of force and distance. Work is done when a force acts on an object in the direction the object moves.

$$W = F \times d$$

- ▶ The unit of force is newtons.
- ▶ The unit of distance is meters.
- ▶ The unit of work is the joule.

# Chapter 14 - Machines

- ▶ Machines make work easier to do. They change the size of the force needed, the direction of a force, or the distance over which a force acts.
- ▶ If a machine increases the distance over which you exert a force, then it decreases the amount of force you need to exert.
- ▶ A machine that decreases the distance through which you exert a force increases the amount of force required.
- ▶ Because of friction, the work done by a machine is always less than the work done on the machine.

# Chapter 14 - Machines

- ▶ The work done by the effort force acting through the effort distance is called the work input.
- ▶ The work output of a machine is the resistance force multiplied by the resistance distance.
- ▶ You cannot get more work out of a machine than you put into it.
- ▶ The mechanical advantage of a machine is the number of times that the machine increases the effort force.

$$\text{AMA} = \frac{\text{resistance force}}{\text{effort force}}$$

$$\text{IMA} = \frac{\text{effort distance}}{\text{resistance distance}}$$

# Chapter 14 - Machines

- ▶ Some resistance force is lost due to friction.
- ▶ No machine has 100 percent efficiency due to friction.
- ▶ The six simple machines are:

## Simple Machines

# Chapter 14 - Machines

- ▶ A lever is a rigid bar that rotates around a fixed point called the fulcrum.
- ▶ The wheel and axle is a simple machine consisting of a large disk (wheel) rigidly secured to a smaller disk (axle).
- ▶ An inclined plane is a slanted surface along which a force moves an object to a different elevation.
- ▶ The wedge is a V-shaped object whose sides are two inclined planes. Narrow wedges have a greater IMA.
- ▶ Screws with threads that are closer together have a greater IMA since it takes less force.
- ▶ A pulley is a simple machine that consists of a rope that fits into a groove in a wheel.
