Notes on Chapter 4-5-6

*Newton*

## Newton's Laws

# Newton's 1<sup>st</sup> Law of Motion

## Inertia

Aristotle

Galileo

Copernicus

THE GREAT THINKERS!

# Newton's 1<sup>st</sup> Law of Motion

## Inertia

*Aristotle* thought of motion in two terms:

- Violent Motion
- Natural Motion

**Natural Motion** is motion in the vertical direction.

Examples: **A tree leaf falls to Earth.**

**Rain falls to Earth**

**Smoke rises into the air**

**Violent Motion** is motion in the horizontal direction.

Examples: **Horse pulling a cart**

**Pushing a rock**

# Newton's 1<sup>st</sup> Law of Motion

## Inertia

Aristotle thought that if there was **NO FORCE**, then there was no movement, except for Natural motion

*Copernicus*, looking at astronomical data, reasoned that the Earth was moving around the sun. This went against the church which said Earth was the center of the universe.

# Newton's 1<sup>st</sup> Law of Motion

## Inertia

Galileo came up with the definitions of **FORCE** and **FRICITION**.

- ◆ **Force** is any push or pull.
- ◆ *Friction is the name given to the force that acts between materials that touch as they move past each other.*

Galileo was concerned with how things move rather than why they move. Galileo stated that every material resists change --- **INERTIA**

# Newton's 1<sup>st</sup> Law of Motion

## Inertia

Newton

## Newton's First Law --- INERTIA

*Every object continues in a state of rest, or of motion in a straight line at constant speed, unless it is compelled to change that state by forces exerted upon it.*

# Newton's 1<sup>st</sup> Law of Motion

## Inertia

*Mass, Volume and Weight* — **NOT** the same

Mass is the amount of matter an object has.

Weight is the force of gravity on an object

Volume is the amount of space an object takes up.

# Newton's 1<sup>st</sup> Law of Motion

## Inertia

### *Units*

Mass / Weight is measured in KILOGRAMS (Kg)

Volume is measured in CUBIC units ( $m^3$ ,  $cm^3$ ,  $mm^3$ )

Force is measured in **NEWTONS (N)**

**One Kg is equal to 9.8 N**

**Or**

**9.8 N is equal to 1 Kg**

# Newton's 1<sup>st</sup> Law of Motion

## Inertia

### *Net Force*

Like vectors we can add and subtract Forces. Net force is equal to the combination of all the forces on a object.

(See figure 2.1 pg 13,)

# Newton's 1<sup>st</sup> Law of Motion

## Inertia

When all the force on a object are equal, then the object is said to be in **equilibrium**. Any object in **equilibrium** is moving at **constant speed and direction, or not moving.**

# Newton's 2<sup>nd</sup> Law of Motion

## Forces and Motion

When a **FORCE** is applied to a object, that object experiences a acceleration during the applied force

If I double a force .... I double the acceleration

If I triple a force .... I triple the acceleration

# Newton's 2<sup>nd</sup> Law of Motion

## Forces and Motion

THEREFORE Force  $\sim$  acceleration

Mass resists acceleration

The larger the mass .... the less the acceleration

THEREFORE acceleration  $\sim 1 / \text{mass}$

# Newton's 2<sup>nd</sup> Law of Motion

## Forces and Motion

Newton's Second Law  
acceleration = force / mass

Or

$$F = ma$$

# Newton's 2<sup>nd</sup> Law of Motion

## Forces and Motion

How I apply a force is

**PRESSURE**

Pressure is force per area.

Units are Pa ...

**Pascal's**

# Newton's 2<sup>nd</sup> Law of Motion

## Forces and Motion

### Free Fall AGAIN

Why do heavy and light objects fall with the same velocity? If you answer  $g$ , how do you explain your answer.

Newton's Second Law is  $a = F / m$

$$a = g$$

$$g = F/m$$

# Newton's 2<sup>nd</sup> Law of Motion

## Forces and Motion

A *heavy* object has large **Force** and large **Mass**

$$F / M$$

A *light* object has small **Force** and small **Mass**

$$F / M$$

then .....

$$F / M = F / M$$

Notice that the ratio of both equal **g**

# Newton's 2<sup>nd</sup> Law of Motion

## Forces and Motion

### What about Air Resistance?

$$a = F / m \quad \text{Force} = \text{weight} - \text{air resistance (R)}$$

$$a = \text{weight} - \text{air resistance} / m \quad (\text{Weight} = mg)$$

$$a = mg - R / m \quad (\text{NOTE: } m \text{ and } m \text{ are the same})$$

$$a = g - R \quad (\text{Note that with air resistance the acceleration WILL always be LESS than } g)$$

# Newton's 2<sup>nd</sup> Law of Motion

## Forces and Motion

THEREFORE .... a skydiver will always fall less than **g**.

This is known as *terminal velocity*.

Terminal Velocity for

– a human is about 150 - 200 km/h

a baseball about 45 km/h

– a tennis ball about 33 km/h

# Newton's 3<sup>rd</sup> Law of Motion

## Action and Reaction

Forces always occur in pairs ...

**action – reaction**

Object **A** exerts a force on object **B**

Object **B** exerts a force back on object **A**

# Newton's 3<sup>rd</sup> Law of Motion

## Action and Reaction

Action and reaction forces are  
**equal in strength** and  
**opposite in direction**

**Example:**

**The earth pulls on a ball**

**The ball pulls on the earth**

# Newton's 3<sup>rd</sup> Law of Motion

## Action and Reaction

# Question:

How does a rocket in outer space move?
