Twelfth Grade Correlation Benchmarks and Indicators
Science

Earth and Space Standard

A. Explain how technology can be used to gather evidence and increase our understanding of the universe.

_____1. Explain how scientists obtain information about the universe by using technology to detect electromagnetic radiation that is emitted, reflected or absorbed by stars and other objects.

_____2. Explain how the large-scale motion of objects in the universe is governed by gravitational forces and detected by observing electromagnetic radiation.

_____3. Explain how information about the universe is inferred by understanding that stars and other objects in space emit, reflect or absorb electromagnetic radiation, which we then detect.

_____4. Explain how astronomers infer that the whole universe is expanding by understanding how light seen from distant galaxies has longer apparent wavelengths than comparable light sources close to Earth.

B. Describe how Earth is made up of a series of interconnected systems and how a change in one system affects other systems.

_____5. Investigate how thermal energy transfers in the world's oceans impact physical features (e.g., ice caps, oceanic and atmospheric currents) and weather patterns.

_____6. Describe how scientists estimate how much of a given resource is available on Earth.

C. Explain that humans are an integral part of the Earth's system and the choices humans make today impact natural systems in the future.

D. Summarize the historical development of scientific theories and ideas and describe emerging issues in the study of Earth and space sciences.

Life Standard

A. Explain how processes at the cellular level affect the functions and characteristics of an organism.

_____1. Recognize that information stored in DNA provides the instructions for assembling protein molecules used by the cells that determine the characteristics of the organism.

_____2. Explain why specialized cells/structures are useful to plants and animals (e.g., stoma, phloem, xylem, blood, nerve, muscle, egg and sperm).

_____3. Explain that the sun is essentially the primary source of energy for life. Plants capture energy by absorbing light and using it to form strong (covalent) chemical bonds between the atoms of carbon-containing (organic) molecules.

_____4. Explain that carbon-containing molecules can be used to assemble larger molecules with biological activity (including proteins, DNA, sugars and fats). In addition, the energy stored in bonds between the atoms (chemical energy) can be used as sources of energy for life processes.

B. Explain how humans are connected to and impact natural systems.

C. Explain how the molecular basis of life and the principles of genetics determine inheritance.

_____5. Examine the inheritance of traits through one or more genes and how a single gene can influence more than one trait.

_____6. Explain how development differentiation is regulated through the expression of different genes.

D. Relate how biotic and abiotic global changes have occurred in the past and will continue to do so in the future.

____10. Explain additional components of the evolution theory, including genetic drift, immigration, emigration and mutation.

E. Explain the interconnectedness of the components of a natural system.

_____7. Relate diversity and adaptation to structures and function of living organisms at various levels of organization.

_____8. Based on the structure and stability of ecosystems and their nonliving components, predict the biotic and abiotic changes in such system when disturbed (e.g., introduction of non-native species, climatic change, etc.).

F. Explain how human choices today will affect the quality and quantity of life on earth.

G. Summarize the historical development of scientific theories and ideas within the study of life sciences.

____11. Trace the historical development of a biological theory or idea (e.g., genetics, cytology and germ theory).

____12. Describe advances in life sciences that have important, long-lasting effects on science and society (e.g., biotechnology)

Physical Standard

A. Explain how variations in the arrangements and motion of atoms and molecules form the basis of a variety of biological, chemical and physical phenomena.

_____1. Explain how atoms join with one another in various combinations in distinct molecules or in repeating crystal patterns.

_____2. Describe how a physical, chemical or ecological system in equilibrium may return to the same state of equilibrium if the disturbances it experiences are small. Large disturbances may cause it to escape that equilibrium and eventually settle into some other state of equilibrium.

_____4. Recognize that at low temperatures some materials become superconducting and offer little or no resistance to the flow of electrons.

B. Recognize that some atomic nuclei are unstable and will spontaneously break down.

____10. Explain the characteristics of isotopes. The nuclei of radioactive isotopes are unstable and spontaneously decay emitting particles and/or wavelike radiation. It cannot be predicted exactly when, if ever, an unstable nucleus will decay, but a large group of identical nuclei decay at a predictable rate.

____11. Use the predictability of decay rates and the concept of half-life to explain how radioactive substances can be used in estimating the age of materials.

C. Describe how atoms and molecules can gain or lose energy only in discrete amounts.

____12. Describe how different atomic energy levels are associated with electron configurations of atoms and electron configurations (and/or conformations) of molecules.

____13. Explain how atoms and molecules can gain or lose energy in particular discrete amounts (quanta or packets); therefore they can only absorb or emit light at the wavelengths corresponding to these amounts.

D. Apply principles of forces and motion to mathematically analyze, describe and predict the net effects on objects or systems.

_____3. Explain how all matter tends toward more disorganized states and describe real world examples (e.g., erosion of rocks and expansion of the universe).

_____5. Use and apply the laws of motion to analyze, describe and predict the effects of forces on the motions of objects mathematically.

_____6. Recognize that the nuclear forces that hold the nucleus of an atom together, at nuclear distances, are stronger than the electric forces that would make it fly apart.

_____7. Recognize that nuclear forces are much stronger than electromagnetic forces, and electromagnetic forces are vastly stronger than gravitational forces. The strength of the nuclear forces explains why greater amounts of energy are released from nuclear reactions (e.g., from atomic and hydrogen bombs and in the sun and other stars).

_____8. Describe how the observed wavelength of a wave depends upon the relative motion of the source and the observer (Doppler effect). If either is moving towards the other, the observed wavelength is shorter; if either is moving away, the observed wavelength is longer (e.g., weather radar, bat echoes and police radar).

_____9. Describe how gravitational forces act between all masses and always create a force of attraction. Recognize that the strength of the force is proportional to the masses and weakens rapidly with increasing distance between them.

E. Summarize the historical development of scientific theories and ideas within the study of physical sciences.

____14. Use historical examples to explain how new ideas are limited by the context in which they are conceived; are often initially rejected by the scientific establishment; sometimes spring from unexpected findings; and usually grow slowly through contributions from many different investigators (e.g., nuclear energy, quantum theory and theory of relativity).

____15. Describe concepts/ideas in physical sciences that have important, long-lasting effects on science and society (e.g., quantum theory, theory of relativity, age of the universe).

Science and Technology Standard

A. Predict how human choices today will determine the quality and quantity of life on Earth.

_____1. Explain how science often advances with the introduction of new technologies and how solving technological problems often results in new scientific knowledge.

_____2. Describe how new technologies often extend the current levels of scientific understanding and introduce new areas of research.

_____3. Research how scientific inquiry is driven by the desire to understand the natural world and how technological design is driven by the need to meet human needs and solve human problems.

_____4. Explain why basic concepts and principles of science and technology should be a part of active debate about the economics, policies and ethics of various science related and technology related challenges.

Scientific Inquiry Standard

A. Make appropriate choices when designing and participating in scientific investigations by using cognitive and manipulative skills when collecting data and formulating conclusions from the data.

_____1. Formulate testable hypotheses. Develop and explain the appropriate procedures, controls and variables (dependent and independent) in scientific experimentation.

_____2. Derive simple mathematical relationships that have predictive power from experimental data (e.g., derive an equation from a graph and vice versa, determine whether a linear or exponential relationship exits among the data is a table).

_____3. Research and apply appropriate safety precautions when designing and/or conducting scientific investigations (e.g., OSHA, MSDS, eyewash, goggles and ventilation).

_____4. Create and clarify the method, procedures, controls and variables in complex scientific investigations.

_____5. Use appropriate summary statistics to analyze and describe data.

B. Explain how scientific evidence is used to develop and revise scientific predictions, ideas or theories.

_____1. Give examples that show how science is a social endeavor in which scientists share their knowledge with the expectation that it will be challenged continuously by the scientific community and others.

_____2. Evaluate scientific investigations by reviewing current scientific knowledge and the experimental procedures used, examining the evidence, identifying faulty reasoning, pointing out statements that go beyond the evidence and suggesting alternative explanations for the same observations.

_____3. Select a scientific model, concept or theory and explain how it has been revised over time based on new knowledge, perceptions or technology.

_____4. Analyze a set of data to derive a principle and then apply that principle to a similar phenomenon (e.g., predator-prey relationships and properties of semiconductors).

_____5. Describe how individuals and teams contribute to science and engineering at different levels of complexity (e.g., an individual may conduct basic field studies, hundred of people may work together on major scientific questions or technical problem).

B. Explain how scientific inquiry is guided by knowledge, observations, ideas and questions.

C. Explain how societal issues and considerations affect the progress of science and technology.

_____6. Explain that scientists may develop and apply ethical tests to evaluate the consequences of their research when appropriate.

_____7. Describe the current and historical contributions of diverse peoples and cultures to science and technology and the scarcity and inaccessibility of information on some of these contributions.

_____8. Recognize that individuals and society must decide on proposals involving new research and the introduction of new technologies into society. Decisions involve assessment of alternative, risks, what the risks are and who bears them.

_____9. Recognize the appropriateness and value of basic questions "What can happen?" "What are the odds?" and "How do scientists and engineers how what will happy?"

____10. Recognize that social issues and challenges can affect progress in science and technology (e.g., Funding priorities for specific health problems serve as examples of way that social issues influence science and technology).

____11. Research how advances in scientific knowledge have impacted society on a local, national or global level.
