# **Lesson Outline for Teaching**

### **Lesson 1: Cells and Life**

### **A.** Understanding Cells

- **1.** <u>Microscopes</u> enable us to see the tiny basic units of all living things.
- **2.** Robert Hooke saw the openings in cork and called them <u>cells</u>.
- **3.** Matthias Schleiden and Theodor Schwann realized that plant and animal cells have similar features.
- **4.** The cell theory has three parts: All living things are made of <u>one or more</u> cells. The cell is the smallest unit of <u>life</u>. All new cells come from <u>preexisting</u> cells.

### **B.** Basic Cell Substances

- 1. Macromolecules form when many small molecules join.
- **2.** The main ingredient of any cell is <u>water</u>.
- **3.** The structure of a water molecule makes it ideal for <u>dissolving</u> many other substances.
- **4.** The four types of <u>macromolecules</u> in cells are nucleic acids, proteins, lipids, and carbohydrates.
- **5.** Nucleic acids form when long chains of molecules called <u>nucleotides</u> join.
- **6.** Nucleic acids are important in cells because they contain genetic information.
- **7.** The macromolecules that are necessary for nearly everything cells do are <u>proteins</u>.
- **8.** Proteins are long chains of <u>amino acid</u> molecules. Some proteins help break down nutrients in food.
- **9.** A(n) <u>lipid</u> is a large macromolecule that does not dissolve in water.
- **10.** Macromolecules that do not mix with water play an important role as protective <u>barriers</u> in cells.
- **11.** One sugar molecule, two sugar molecules, or long chains of sugar molecules make up <u>carbohydrates</u>.
- **12.** Carbohydrates store <u>energy</u> and provide structural support. They also are used for communication between cells.

## **Discussion Question**

What are cells?

Cells are the basic units of all living things.
