

Chapter 35.

Plant Anatomy

Basic anatomy

- root
- shoot (stem)
- leaves

Expanded anatomy

- **root**
 - ◆ root tip
 - ◆ root hairs
- **shoot (stem)**
 - ◆ nodes
 - ◆ internodes
 - ◆ apical buds
 - ◆ axillary buds
 - ◆ flowers
- **leaves**
 - ◆ veins

Shoots

- Shoots consist of stems, leaves & buds
- Stems
 - ◆ nodes = points at which leaves are attached
 - ◆ internodes = stem segments between nodes
- Buds
 - ◆ growth of shoot
 - terminal or apical bud = at tip of plant
 - axillary bud = in nodes on stem

Modified shoots

stolons (strawberries)

rhizome (ginger)

tuber (potato)

bulb (onion)

Roots

- **Roots anchor plant in soil, absorb minerals & water, & store food**
 - ◆ **fibrous roots (1)**
 - mat of thin roots that spread out
 - monocots
 - ◆ **tap roots (2)**
 - 1 large vertical root
 - also produces many small lateral, or branch roots
 - dicots
 - ◆ **root hairs (3)**
 - increase absorptive surface area

Leaves

- **Function of leaves?**
 - ◆ **photosynthesis**
 - energy production
 - CHO production
 - ◆ **gas exchange**
 - ◆ **transpiration**

simple vs. compound

Figure 25. Stomata open to allow carbon dioxide (CO_2) to enter a leaf and water vapor to leave.

Stomates

Function of stomates?

Modified leaves

tendrils (peas)

spines (cacti)

AP Biology **succulent leaves**

colored leaves (poinsettia)

Interdependent systems

- Both systems depend on the other
 - ◆ roots receive sugars & other nutrients from photosynthetic parts
 - ◆ shoot system depends on water & minerals absorbed from the soil by roots

Putting it all together

■ Obtaining raw materials

◆ sunlight

- leaves = solar collectors

◆ CO₂

- stomates = gas exchange

◆ H₂O

- uptake from roots

◆ nutrients

- uptake from roots

Figure 24. Photosynthesis, respiration, leaf water exchange, and translocation of sugar (photosynthate) in a plant.

Plant tissues

- **Dermal**
 - ◆ “skin” of plant
 - ◆ single layer of tightly packed cells that covers & protects plant
- **Vascular**
 - ◆ transport materials between roots & shoots
 - ◆ xylem & phloem
- **Ground**
 - ◆ everything else: storage, photosynthetic
 - ◆ bulk of plant tissue

2005-2006

Plant cell types in tissues

(a) Parenchyma cells

(b) Collenchyma cells

(c) Sclerenchyma cells:
Fiber cells

Sclerenchyma cells: Sclereids

50 μm

Plant cell types in tissues

Those would've
been great names
for my kids!

■ Parenchyma

- ◆ “typical” plant cells = least specialized
- ◆ photosynthetic cells, storage cells
- ◆ tissue of leaves, stem, fruit, storage roots

■ Collenchyma

- ◆ unevenly thickened primary walls = support

■ Sclerenchyma

- ◆ very thick, “woody” secondary walls = support
- ◆ rigid cells that can’t elongate
- ◆ dead at functional maturity

Parenchyma

- Parenchyma cells are relatively unspecialized, thin, flexible & carry out many metabolic functions
 - ◆ all types of cells develop from parenchyma

Stem cross-section showing tissue systems.

Ground Tissue
(Parenchyma)

Epidermal
Tissue

Vascular Tissue
(Xylem and
Phloem)

Collenchyma

- Collenchyma cells have thicker primary walls & provide support
 - ◆ help support without restraining growth
 - ◆ remain alive in maturity

Parenchyma cells

Collenchyma cells

LM 61x

the strings in celery stalks are collenchyma

Sclerenchyma

- **Thick, rigid cell wall**
 - ◆ lignin (wood)
 - ◆ cannot elongate
 - ◆ mostly dead at maturity
- **Support cells**
 - ◆ xylem vessels
 - ◆ tracheids
 - ◆ fibers
 - rope fibers
 - ◆ sclereids
 - nutshells
 - seed coats
 - grittiness in pears

Vascular tissue

- Transports materials in roots, stems & leaves
- Xylem
 - ◆ carry water & minerals up from roots
 - ◆ tube-shaped dead cells
 - only their walls provide a system of microscopic water pipes
- Phloem
 - ◆ carry nutrients throughout plant
 - sugars (sucrose), amino acids...
 - ◆ tube-shaped living cells

tracheids

vessel
elements

Xylem

dead cells →
water-conducting
cells of xylem

Xylem

- Dead at functional maturity
- Cell elongated into tubes
 - ◆ tracheids
 - long, thin cells with tapered ends
 - walls reinforced with lignin = support
 - thinner pits in end walls allows water flow
 - ◆ vessel elements
 - wider, shorter, thinner walled & less tapered
 - perforated ends walls allows free water flow

Phloem: food-conducting cells

- sieve tube elements & companion cells

(a) Longitudinal view

(b) Transverse section (LM)

Phloem: food-conducting cells

- sieve tube elements & companion cells

Phloem

- Living cells at functional maturity
 - ◆ lack nucleus, ribosomes & vacuole
 - more room: specialized for liquid food (sucrose) transport
- Cells
 - ◆ sieve tubes
 - end walls, sieve plates, have pores to facilitate flow of fluid between cells
 - ◆ companion cells
 - nucleated cells connected to the sieve-tube
 - help sieve tubes

Aaaaah...
Structure-Function
again!

Phloem

sieve plate

**sieve
tubes**

Vascular tissue in herbaceous stems

dicot
trees & shrubs

(a) Dicot

monocot
grasses & lilies

(b) Monocot

Root structure: dicot

phloem

xylem

**THREE
PRIMARY
TISSUES:**

Epidermis
(dermal)

Cortex
(ground)

Stele
(vascular)

Endodermis

Pericycle

Pith

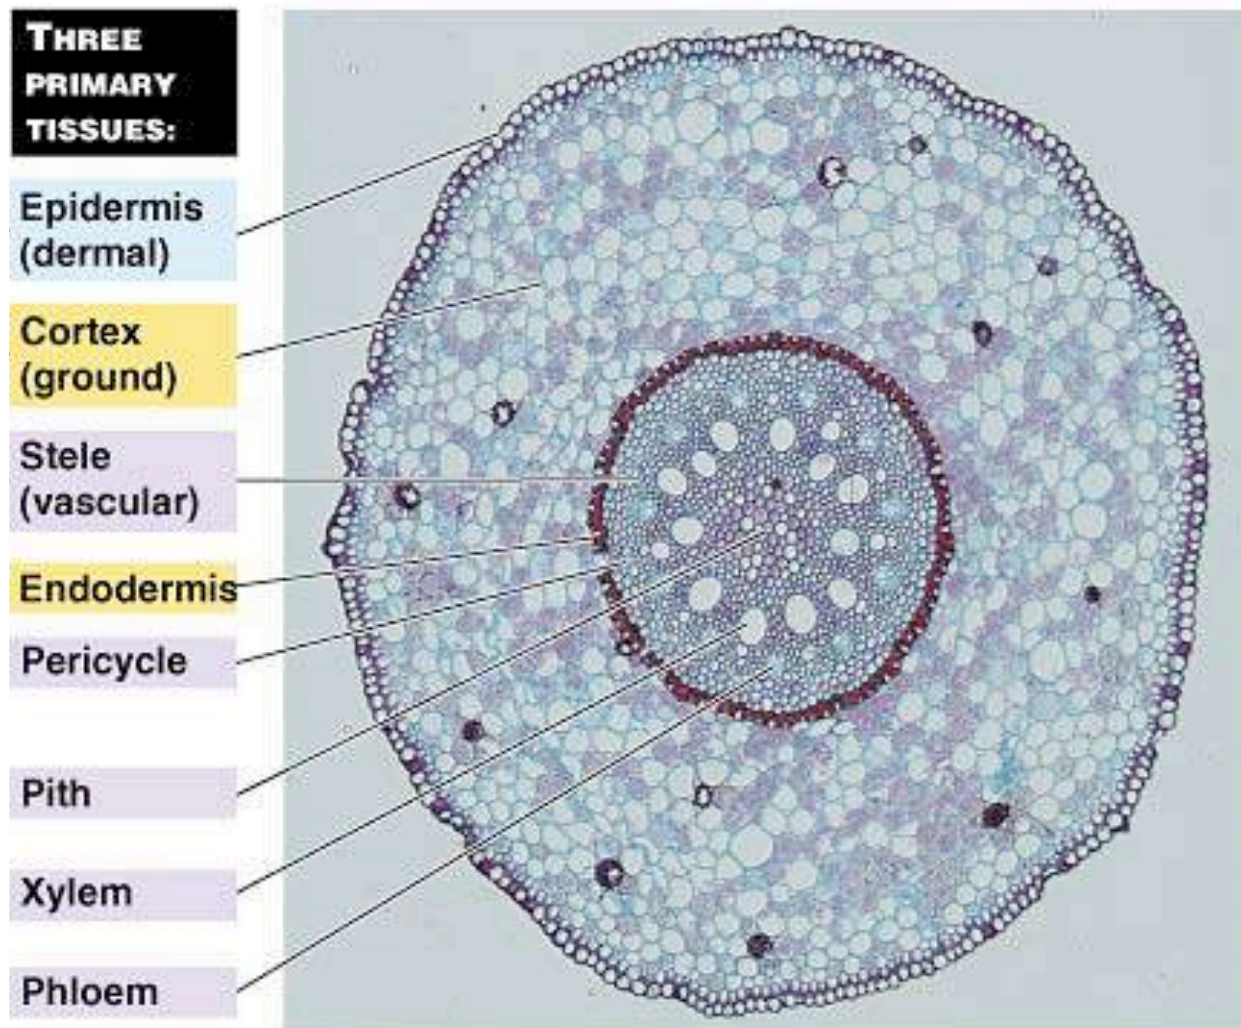

Xylem

Phloem

(a) Cross section of a dicot root

500 μm

Root structure: monocot

(b) Cross section of a monocot root

100 μm 5-2006

Any Questions??
