From the Common Core State Standards:

In **Grade 7**, instructional time should focus on four critical areas: (1) developing understanding of and applying proportional relationships; (2) developing understanding of operations with rational numbers and working with expressions and linear equations; (3) solving problems involving scale drawings and informal geometric constructions, and working with two- and three-dimensional shapes to solve problems involving area, surface area, and volume; and (4) drawing inferences about populations based on samples.

1. Students extend their understanding of ratios and develop understanding of proportionality to solve single- and multi-step problems. Students use their understanding of ratios and proportionality to solve a wide variety of percent problems, including those involving discounts, interest, taxes, tips, and percent increase or decrease. Students solve problems about scale drawings by relating corresponding lengths between the objects or by using the fact that relationships of lengths within an object are preserved in similar objects. Students graph proportional relationships and understand the unit rate informally as a measure of the steepness of the related line, called the slope. They distinguish proportional relationships from other relationships.

2. Students develop a unified understanding of number, recognizing fractions, decimals (that have a finite or a repeating decimal representation), and percents as different representations of rational numbers. Students extend addition, subtraction, multiplication, and division to all rational numbers, maintaining the properties of operations and the relationships between addition and subtraction, and multiplication and division. By applying these properties, and by viewing negative numbers in terms of everyday contexts (e.g., amounts owed or temperatures below zero), students explain and interpret the rules for adding, subtracting, multiplying, and dividing with negative numbers. They use the arithmetic of rational numbers as they formulate expressions and equations in one variable and use these equations to solve problems.

3. Students continue their work with area from Grade 6, solving problems involving the area and circumference of a circle and surface area of three dimensional objects. In preparation for work on congruence and similarity in Grade 8 they reason about relationships among two-dimensional figures using scale drawings and informal geometric constructions, and they gain familiarity with the relationships between angles formed by intersecting lines. Students work with three-dimensional figures, relating them to two-dimensional figures by examining cross-sections. They solve real-world and mathematical problems involving area, surface area, and volume of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes and right prisms.

4. Students build on their previous work with single data distributions to compare two data distributions and address questions about differences between populations. They begin informal work with random sampling to generate data sets and learn about the importance of representative samples for drawing inferences.

A STORY OF UNITS

7	The Number System			Expressions & Equations		Ratios & Proportional Relationships		Statistics & Probability /Geometry		

The Number System:
Operations with
Rational Numbers

Expressions & Equations: Use properties of operations to generate equivalent fractions and solve real-life problems using numerical & algebraic expressions & equations

Ratios & Proportional Relationships:
Analyze proportional relationships and use them to solve real-world and mathematical problems

Statistics & Probability / Geometry: Use random sampling, draw inferences, investigate chance processes, evaluate probability models, construct geometrical figures, and solve real-life problems.

I. Unit Overview

Chapter 9: Statistics: In this chapter, students will learn to identify measures of variation. They divide a data set into quartiles and identify the interquartile range. Students draw and interpret stem-and-leaf plots and box-and-whisker plots. They learn to find the mean absolute deviation. In addition, they learn about populations and samples. They understand and apply different random sampling methods, use statistics from a sample to make inferences about population, and use an inference to estimate a population mean.

Chapter 10: Probability: In this chapter, students learn about chance processes and measuring the likelihood of events. Students learn to distinguish between theoretical and experimental probability. Students begin to recognize that as the number of trials increases in an experiment with a chance process, the experimental probability measures tend to approach the values of theoretical probability measures.

Essential Questions

- How can we make generalizations from a sample to a population?
- How can random sampling be used to draw inferences about a population?
- How can we analyze data/graphs and describe patterns?
- What influences the probability that a given event will occur?
- What is the difference between experimental and theoretical probability?
- What determines whether an event is dependent or independent?
- How can we use modeling to form a prediction?
- Can we construct more than one kind of graph from the same set of data?

Enduring Understanding

- Reading, understanding, interpreting, and communicating data are critical in modeling a variety of real-world situations, drawing appropriate inferences, making informed decisions, and justifying those decisions.
- Probability quantifies the likelihood that something will happen and enables us to make predictions and informed decisions.
- The chance of an event happens may be represented by use of decimals, fractions, and or percentages.

IV. NJSLA Assessment Evidence Statements

Type I

Type II

Type III

NJSLS	Evidence Statement	Clarification	Math Practices	Calculator ?
<u>7.SP.1</u>	Understand that statistics can be used to gain information about a population by examining a sample of the population; generalizations about a population from a sample are valid only if the sample is representative of that population. Understand that random sampling tends to produce representative samples and support valid inferences.		MP. 4	Yes
<u>7.SP.2</u>	Use data from a random sample to draw inferences about a population with an unknown characteristic of interest. Generate multiple samples (or simulated samples) of the same size to gauge the variation in estimates or predictions. For example, estimate the mean word length in a book by randomly sampling words from the book; predict the winner of a school election based on randomly sampled survey data. Gauge how far off the estimate or prediction might be.		MP. 4	Yes
<u>7.SP.3</u>	Informally assess the degree of visual overlap of two numerical data distributions with similar variabilities, measuring the difference between the centers by expressing it as a multiple of a measure of variability. For example, the mean height of players on the basketball team is 10cm greater than the mean height of players on the soccer team, about twice the variability (mean absolute deviation) on either team; on a dot plot, the separation between the two distributions of heights is noticeable.	i) Tasks may use mean absolute deviation, range, or interquartile range as a measure of variability	MP. 4	Yes
<u>7.SP.4</u>	Use measures of center & measures of variability for numerical data from random samples to draw informal comparative inferences about two populations. E.g., decide whether the words in a chapter of a seventh grade science book are generally longer than the words in a chapter of a fourth grade science book.		MP. 4	Yes

7th Grade Unit 4: Statistics & Probability / Geometry (MIF)

<u>7.SP.5</u>	Understand that the probability of a chance event is a number between 0 and 1 that expresses the likelihood of the event occurring. Larger numbers indicate greater likelihood. A probability near 0 indicates an unlikely event, a probability around 1/2 indicates an event that is neither unlikely nor likely, and a probability near 1 indicates a likely event.	i) Tasks may involve probabilities that are certain (1) or impossible (0).	MP. 4	Yes
<u>7.SP.6</u>	Approximate the probability of a chance event by collecting data on the chance process that produces it and observing its long-run relative frequency, and predict the approximate relative frequency given the probability. For example, when rolling a number cube 600 times, predict that a 3 or 6 would be rolled roughly 200 times, but probably not exactly 200 times.	i) Tasks require the student to make a prediction based on long-run relative frequency in data from a chance process.	MP. 4	Yes
<u>7.SP.7a</u>	Develop a probability model and use it to find probabilities of events. Compare probabilities from a model to observed frequencies; if the agreement is not good, explain possible sources of the discrepancy. a. Develop a uniform probability model by assigning equal probability to all outcomes, and use the model to determine probabilities of events. For example, if a student is selected at random from a class, find the probability that Jane will be selected and the probability that a girl will be selected.	i) Simple events only	MP. 4	Yes
<u>7.SP.7b</u>	Develop a probability model & use it to find probabilities of events. Compare probabilities from a model to observed frequencies; if the agreement isn't good, explain possible sources of the discrepancy. b. Develop a probability model (may not be uniform) by observing frequencies in data generated from a chance process. e.g. find the approximate probability that a spinning penny will land heads up or a tossed paper cup will land open-end down. Do the outcomes for the spinning penny appear equally likely based on the observed frequencies?		MP. 4	Yes

7th Grade Unit 4: Statistics & Probability / Geometry (MIF)

<u>7.SP.8a</u>	Find probabilities of compound events using organized lists, tables, tree diagrams, and simulation. a. Understand that, just as with simple events, the probability of a compound event is the fraction of outcomes in the sample space for which the compound event occurs		MP. 4 MP. 5	Yes
<u>7.SP.8b</u>	Find probabilities of compound events using organized lists, tables, tree diagrams, and simulation. b. Represent sample spaces for compound events using methods such as organized lists, tables and tree diagrams. For an event described in everyday language (e.g., “rolling double sixes”), identify the outcomes in the sample space, which compose the event		MP. 4 MP. 5	Yes
<u>7.SP.8c</u>	Find probabilities of compound events using organized lists, tables, tree diagrams, and simulation. c. Design and use a simulation to generate frequencies for compound events. For example, use random digits as a simulation tool to approximate the answer to the question: If 40% of donors have type A blood, what is the probability that it will take at least 4 donors to find one with type A blood?		MP. 4 MP. 5	Yes
<u>7.G.1</u>	Solve problems involving scale drawings of geometric figures, including computing actual lengths and areas from a scale drawing and reproducing a scale drawing at a different scale.	i) Tasks may or may not have context	MP.2 MP.5	No
<u>7.G.2</u>	Draw (freehand, with ruler and protractor, and with technology) geometric shapes with given conditions. Focus on constructing triangles from three measures of angles or sides, noticing when the conditions determine a unique triangle, more than one triangle, or no triangle.	i) Tasks do not have a context. ii) Most of tasks should focus on the drawing component of this evidence statement.	MP. 3 MP. 5 MP. 6	Yes

7th Grade Unit 4: Statistics & Probability / Geometry (MIF)

<u>7.G.4-1</u>	Know the formulas for the area and circumference of a circle and use them to solve problems.	i) Tasks may or may not have context. ii) Tasks may require answers to be written in terms of π	MP. 4 MP. 5	Yes
<u>7.G.4-2</u>	Give an informal derivation of the relationship between the circumference and area of a circle.	i) Tasks require students to identify or produce a logical conclusion about the relationship between the circumference and the area of a circle.	MP. 2 MP. 5	Yes
<u>7.G.5</u>	Use facts about supplementary, complementary, vertical, and adjacent angles in a multi-step problem to write and solve simple equations for an unknown angle in a figure.	i) Tasks may or may not have context. ii) Tasks involving writing or solving an equation should not go beyond the equation types described in 7.EE.4a. [$px + q = r$ and $p(x + q) = r$ where p , q , and r are specific rational numbers.]	MP. 5 MP. 6	Yes
<u>7.G.6</u>	Solve real-world and mathematical problems involving area, volume, and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms.	i) Tasks may or may not have context	MP.2 MP.5	No
<u>7.D.1</u>	Solve multi-step contextual word problems with degree of difficulty appropriate to Grade 7, requiring application of knowledge and skills articulated in Type I, Sub-Claim A Evidence Statements.	i) Tasks may have scaffolding, if necessary, in order to yield a degree of difficulty appropriate to grade 7. ii) Tasks involving writing or solving an equation should not go beyond the equation types described in 7.EE.4a. ($px + q = r$ and $p(x + q) = r$ where p , q , and r are specific rational number	MP.1 MP.2 MP.4 MP.5 MP.7	Yes
<u>7.D.2</u>	Solve multi-step contextual problems with degree of difficulty appropriate to grade 7, requiring application of knowledge and skills articulated in 6.RP.A, 6.EE.C, 6.G.	i) Tasks may have scaffolding, if necessary, in order to yield a degree of difficulty appropriate to grade 7.	MP.1 MP.2 MP.4 MP.5 MP.7	Yes

V. Differentiated Instruction

Chapter 9**Assessment and Intervention**

	ASSESSMENT	 STRUGGLING LEARNERS
DIAGNOSTIC	- Quick Check in Recall Prior Knowledge in Student Book B, pp. 178–181 - Chapter 9 Pre-Test in Assessments	Skills 44–46 in <i>Transition Guide, Course 2</i>
ON-GOING	- Guided Practice - Lesson Check - Ticket Out the Door	- Reteach worksheets - Extra Practice worksheets - Activity Book, Chapter 9
END-OF-CHAPTER	- Chapter Review/Test - Chapter 9 Test in Assessments - ExamView® Assessment Suite CD-ROM Course 2	Reteach worksheets

ELL ENGLISH LANGUAGE LEARNERS

Review the terms *mean*, *median*, and *quartile*.

Model Write the following set of 11 values on the board.
4, 12, 1, 19, 20, 11, 3, 14, 8, 2, 16

Say There are many way to describe a set of numbers. One way is to identify the center. One measure of the center of a set is the *mean*. (Demonstrate how to calculate the mean, 10.) Another measure of the center is the *median*. *Median* means “middle number.” (Order the values and identify the median, 11.) The median divides a set into two equal parts. Half the numbers are less than the median. Half the numbers are greater than the median.

Say You also can divide a set into equal fourths. Find the median of each half. (Count to identify Q_1 as 3 and Q_3 as 16) The points that divide a set of numbers into equal fourths are called *quartiles*. Like the word *quarter*, *quartile* means “one-fourth.”

For definitions, see Glossary, page 321, and  Online Multi-Lingual Glossary.

ADVANCED LEARNERS

- Students can explore how changes to a data set affect the MAD. Give them a problem like the one below.
Arthur lives 10 miles away from an amusement park. Roya lives 2 miles away. Tony lives 1 mile away. Chrissy lives 7 miles away. And Luis lives 5 miles away. Plot the distances on a number line. Identify the mean, and find the MAD. (5 miles; 2.8 miles)
- After they have solved the problem, have students revise the data set twice. In both revisions the mean should remain the same. In one set, the new MAD should be less than the original MAD. In the other, the new MAD should be greater than the original MAD.
- As needed, provide direction for students, such as telling them that the way to maintain the mean is to make sure the sum of their changes to the lower half of the data set is the opposite of the sum of the changes to the upper half of the data set.

To provide additional challenges use:

- Enrichment*, Chapter 9
- Student Book B, Brain@Work problem

Chapter 10

Assessment and Intervention

	ASSESSMENT	 STRUGGLING LEARNERS
DIAGNOSTIC	- Quick Check in Recall Prior Knowledge in Student Book B, pp. 241–244 - Chapter 10 Pre-Test in Assessments	Skills 47–51 in <i>Transition Guide, Course 2</i>
ON-GOING	- Guided Practice - Lesson Check - Ticket Out the Door	- Reteach worksheets - Extra Practice Worksheets, Chapters 9–10 - Cumulative Practice worksheets - Activity Book, Chapter 10
END-OF-CHAPTER	- Chapter Review/Test - Chapter 10 Test, End-of-Course Test in Assessments  ExamView® Assessment Suite CD-ROM Course 2	Reteach worksheets

ELL ENGLISH LANGUAGE LEARNERS

Review the terms *impossible*, *certain*, and *likely*.

Model Copy the number line from page 251 of the student book. Draw a bag with 4 white marbles.

Ask What is the chance of picking a red marble from the bag? (*No chance*)

Say It is *impossible* to pick a red marble. The chance is $\frac{0}{4}$, 0, or 0%.

Ask What is the chance of picking a white marble from the bag? (*4 out of 4*)

Say The chance of picking a white marble from the bag is *certain*. The chance is $\frac{4}{4}$, 1, or 100%. (Draw 1 black marble inside the bag.)

Ask Now what is the chance of picking a white marble from the bag? (*4 out of 5*)

Say It is *likely* that you will pick a white marble. The chance is $\frac{4}{5}$, 0.80, or 80%. It is greater than 50%.

Continue the process, to include *unlikely* and 50%.

For definitions, see Glossary, page 321, and  Online Multi-Lingual Glossary.

ADVANCED LEARNERS

- Students can conduct an experiment or otherwise collect observed frequency data in order to compare the theoretical probability of outcomes to their experimental probability.
- Have students design a simple experiment or a survey question, identify all the possible outcomes, and find the theoretical probability of each. Then have students conduct the experiment or survey, collect observed frequency data, and calculate the relative frequency of each expected outcome.
- As needed, provide direction for students, such as reminding them to choose an experiment or survey question for which they can first calculate theoretical probability. For example, students can flip a coin, toss a number die (or two), or survey students about their month of birth.

To provide additional challenges use:

- Enrichment, Chapter 10
- Student Book B, Brain@Work problem

Chapter 6

Assessment and Intervention

	ASSESSMENT	 STRUGGLING LEARNERS
DIAGNOSTIC	- Quick Check in Recall Prior Knowledge in Student Book B, pp. 3–4 - Chapter 6 Pre-Test in Assessments	Skills 32–33 in <i>Transition Guide, Course 2</i>
ON-GOING	- Guided Practice - Lesson Check - Ticket Out the Door	<i>Reteach</i> worksheets <i>Extra Practice</i> worksheets <i>Activity Book</i>, Chapter 6
END-OF-CHAPTER	- Chapter Review/Test - Chapter 6 Test in Assessments  ExamView® Assessment Suite CD-ROM Course 2	<i>Reteach</i> worksheets

ENGLISH LANGUAGE LEARNERS

Review the terms *interior* and *exterior*.

Say The *interior* is the inside of something. (Place a pencil inside a plastic bag.) The pencil is in the *interior* of the bag. The *exterior* is the outside of something. (Take the pencil out of the bag and hold it next to it.) The pencil is in the *exterior* of the bag.

Model Draw a number of polygons. Have volunteers shade the interiors red and the exteriors yellow. Draw a pair of parallel lines.

Say Look at the parallel lines. The *interior* is the area between the lines. (Have a volunteer shade the area between the lines red.) The *exterior* is the area outside the lines. (Have a volunteer shade the area outside the lines yellow.)

Model Draw a pair of parallel lines crossed by a transversal. Have volunteers shade the interior angles red and the exterior angles yellow.

For definitions, see Glossary, page 321, and

Online Multi-Lingual Glossary.

ADVANCED LEARNERS

- In this chapter, students learn a number of properties of certain angle pairs created when two parallel lines are crossed by a transversal intersecting the parallel lines at points *A* and *B*. Challenge students to use the properties they have learned in order to prove that two lines are parallel.
- Draw a pair of lines that could be parallel, crossed by a transversal. Number each angle formed. Specify that one pair of corresponding angles is congruent. Have students write a proof that shows the two lines are parallel.
- As needed, provide direction for students, such as suggesting that they consider what would happen if the lines were not parallel. That is, the two supposedly parallel lines intersect at a point *C*. Then, using supplementary angles, students can show the sum of the measures of the interior angles of triangle *ABC* is greater than 180° , which is impossible. Hence, the two lines must be parallel.
- This makes a nice introduction to indirect proofs for your advanced learners.

To provide additional challenges use:

- Enrichment*, Chapter 6
- Student Book B, Brain@Work problem

Chapter 7**Assessment and Intervention**

	ASSESSMENT	 STRUGGLING LEARNERS
DIAGNOSTIC	- Quick Check in Recall Prior Knowledge in Student Book B, pp. 63–68 - Chapter 7 Pre-Test in Assessments	Skills 34–39 in <i>Transition Guide, Course 2</i>
ON-GOING	- Guided Practice - Lesson Check - Ticket Out the Door	- Reteach worksheets - Extra Practice worksheets - Activity Book, Chapter 7
END-OF-CHAPTER	- Chapter Review/Test - Chapter 7 Test in Assessments  ExamView® Assessment Suite CD-ROM Course 2	Reteach worksheets

ELL ENGLISH LANGUAGE LEARNERS

Review the terms *construct*, *midpoint*, and *equidistant*.

Say When you *construct* something you make it. You build it. You can construct a house of wood. You can construct a toy airplane of paper. You can construct an angle bisector with a compass and a straightedge. A thing you construct is called a *construction*.

Model Draw a line segment AB. Draw its perpendicular bisector.

Say The middle point of a line segment is called the *midpoint*. (Mark the midpoint, C.) The midpoint, C, divides $\overline{AB}$ into two equal parts. (Indicate the equal parts and write $AC = CB$.) The distance from A to the midpoint, C, is the same as the distance from B to the midpoint, C. The midpoint is an equal distance from both ends of the segment. We say the midpoint is *equidistant* from both ends of the segment.

For definitions, see Glossary, page 321, and

Online Multi-Lingual Glossary.

ADVANCED LEARNERS

- Students can explore scale factors when a figure is enlarged and/or reduced repeatedly. Ask them to solve the following problem.

A photo has side lengths of 8 in. and 10 in. It is enlarged to three times its original size. Then the enlargement is reduced to half its size. What is the final size of the photo? (12 in. by 15 in.) What scale factor relates the final photo to the original? $\left(\frac{3}{2}\right)$

- As needed, provide direction for students, such as suggesting they sketch each version of the photo.
- Finally, ask students to state a rule for finding the scale factor that compares an original figure to a version that has been reduced and/or enlarged multiple times. (The scale factor that compares the original figure to the final figure is the product of all the individual scale factors.)

To provide additional challenges use:

- Enrichment, Chapter 7
- Student Book B, Brain@Work problem

Chapter 8

Assessment and Intervention

	ASSESSMENT	 STRUGGLING LEARNERS

 **ENGLISH LANGUAGE LEARNERS**

Review the terms *height*, *lateral surface*, and *slant height*.

Model Draw a right circular cone and a right square pyramid.

Say The *height* of a solid is how tall it is. On a cone or pyramid, the height is the distance from the base to the vertex. (Draw heights.) The height forms a right angle with the base. (Add right angle symbols.)

Model The sides of a solid are called its *lateral surface*. (Indicate lateral surfaces of cone and pyramid.) The word *lateral* means “side.” The word *slant* means “sloping.” On a cone, the *slant height* is the distance from the vertex to any point on the circumference of the base. (Draw slant height.) On a pyramid, the slant height is the distance from the vertex to the center point of any side of the base. (Draw slant height.)

For definitions, see Glossary, page 321, and  Online Multi-Lingual Glossary.

ADVANCED LEARNERS

- Pairs of students can brainstorm a process for using water to determine the volume of an irregularly shaped object. Give each pair a small irregular stone. Point out that its shape makes it impossible to use regular solids to determine its volume mathematically. Ask students to devise a procedure for using water to find the volume of the stone.
- Students are being asked to “discover” the displacement method of measuring volume. As needed, provide direction for students, such as telling them to look back at exercise 6 in Practice 8.4 for a hint (the conversion factor).
- Students' procedures should involve the following steps: pouring water into a graduated cylinder; noting its volume; submerging the stone in the cylinder; noting the combined volume; finding the difference of the two measurements converting milliliters to cubic centimeters.

To provide additional challenges use:

- Enrichment*, Chapter 8
- Student Book B, Brain@Work problem

VI. Vocabulary

Term	Definition
Chapter 6	
<i>adjacent angles</i>	Two angles that share a common vertex and side, but have no common interior points.
<i>alternate exterior angles</i>	The pairs of angles on opposite sides of the transversal for two lines, but outside the two lines.
<i>alternate interior angles</i>	The pairs of angles on opposite sides of the transversal for two lines, but inside the two lines.
<i>complementary angles</i>	Two angles whose angle measures total 90°.
<i>congruent angles</i>	Two or more angles that have the same angle measure.
<i>corresponding angles</i>	The pairs of angles on the same side of the transversal for two lines and on the same side of the given lines.
<i>exterior angles</i>	The angle formed by one side of a polygon and the extension of an adjacent side.
<i>interior angles</i>	Angles formed by two adjacent sides of a polygon.
Chapter 7	
<i>bisector</i>	A ray that divides an angle into two angles with equal measures.
<i>midpoint</i>	The point on a line segment that is equidistant from both endpoints
<i>perpendicular bisector</i>	A line that bisects a line segment and is perpendicular to it.
<i>scale</i>	A comparison of a length in a scale drawing to the corresponding length in the actual object.
<i>scale factor</i>	The ratio of a length in a scale drawing to the corresponding length in the actual figure
Chapter 8	
<i>cone</i>	A solid with a circular base, a curved surface, and one vertex.
<i>cross section</i>	A figure formed by the intersection of a solid figure and a plane.
<i>cylinder</i>	A solid with a curved surface and two parallel bases that are congruent circles.
<i>hemisphere</i>	Half of a sphere.
<i>lateral surface</i>	The curved surface of a cone or cylinder.
<i>plane</i>	A flat surface that extends infinitely in two dimensions.
<i>slant height of cone</i>	The distance from the vertex to any point on the circumference of the base
<i>slant height of pyramid</i>	In a regular pyramid, it is the distance from the vertex to the midpoint of any edge of the base
Chapter 9	
<i>biased sample</i>	A sample in which members are not randomly selected.
<i>box plot</i>	A graphical display of the 5-point summary.
<i>box-and-whisker plot</i>	Also known as the box plot.
<i>first quartile</i>	Also known as the lower quartile; it is the median of the lower half of a data set
<i>5-point summary</i>	Consists of five data values: the lower extreme value, the first quartile, the median, the third quartile, and the upper extreme value.
<i>inference</i>	A conclusion about a population, made by projecting the results of a representative sample onto the whole population.

<i>interquartile range</i>	The difference between the first and the third quartiles.
Chapter 10	
<i>biased</i>	A sample space in which one or more outcomes are favored.
<i>complementary event</i>	The complement of an event E consists of all the outcomes in the sample space that are not in event E.
<i>event</i>	A collection of outcomes from an activity
<i>experimental probability</i>	Probability based on data collected or observations made in an experiment.
<i>fair</i>	An experiment in which the probability of each outcome is the same.
<i>mutually exclusive events</i>	Two events that cannot happen at the same time.
<i>nonuniform probability model</i>	A probability model in which the outcomes do not necessarily have equal probabilities

VII. Assessment Framework

Unit 4 Assessment Framework				
Assessment	NJSLS	Estimated Time	Format	Graded ?
Chapter 9 Pretest (Beginning of Unit) <i>Math in Focus</i>	7.SP.1; 7.SP.2; 7.SP.3; 7.SP.4;	½ Block	Individual	Yes (No Weight)
Chapter 9 Test (Beginning of Unit) <i>Math in Focus</i>	7.SP.1; 7.SP.2; 7.SP.3; 7.SP.4;	½ Block	Individual	Yes
Chapter 10 Pretest (After Chapter 9) <i>Math in Focus</i>	7.SP.5; 7.SP.6; 7.SP.7; 7.SP.8	½ Block	Individual	Yes (No Weight)
Chapter 10 Test (After Chapter 9) <i>Math in Focus</i>	7.SP.5; 7.SP.6; 7.SP.7; 7.SP.8	½ Block	Individual	Yes
Unit 4 Assessment (After Chapter 10) <i>District Assessment</i>	7.SP.1; 7.SP.2; 7.SP.3; 7.SP.4; 7.SP.5; 7.SP.6; 7.SP.7; 7.SP.8	½ Block	Individual	Yes
Chapter 6-8 Test (Optional) <i>Math in Focus</i>	7.G.1; 7.G.2; 7.G.3; 7.G.4; 7.G.5; 7.G.6;	½ Block	Individual	Yes, if administered
Grade 7 Interim Assessment 4 (Early June) <i>District Assessment</i>	7.SP.1; 7.SP.2; 7.G.1; 7.G.2	1 Block	Individual	Yes

Unit 4 Performance Assessment Framework				
Assessment	NJSLS	Estimated Time	Format	Graded ?
Unit 4 Performance Task 1 (Mid-May) <i>College Athletes</i>	7.SP.3; 7.SP.4	1 Block	Individual	Yes; Rubric
Unit 4 Performance Task 2 (Mid-June) <i>Rolling Dice</i>	7.SP.6	1 Block	Individual w/ Interview Opportunity	Yes; Rubric
Extended Constructed Response (ECR)* (click here for access)	Dependent on unit of study & month of administration	Up to 30 minutes	Individual	Yes; Rubric

* Use the following links to access ECR protocol and district assessment scoring documents:

7th Grade Portfolio Assessment: Unit 4 Performance Task 1

Name _____

Block _____

Date _____

College Athletes (7.SP.3, 7.SP.4)

Below are the heights of the players on the University of Maryland women's basketball team for the 2012-2013 season and the heights of the players on the women's field hockey team for the 2012 season.

Field Hockey Player Heights (inches)	Basketball Player Heights (inches)
66	75
64	65
66	76
63	75
67	76
62	72
62	67
64	69
64	74
64	68
65	74
66	79
65	
64	
63	
62	
62	
68	
68	
66	
70	
67	
65	
62	
64	

- Based on visual inspection of the dot plots, which group appears to have the larger average height? Which group appears to have the greater variability in the heights?
- Compute the mean and mean absolute deviation (MAD) for each group. Do these values support your answers in part (a)?
- How many of the 12 basketball players are shorter than the tallest field hockey player?
- Imagine that an athlete from one of the two teams told you she needs to go to practice. You estimate that she is about 65 inches tall. If you had to pick, would you think that she was a field hockey player or that she was a basketball player? Explain your reasoning.
- The women on the Maryland field hockey team are not a random sample of all female college field hockey players. Similarly, the women on the Maryland basketball team are not a random sample of all female college basketball players. However, for purposes of this task, suppose that these two groups can be regarded as random samples of all female college field hockey players and all female college basketball players, respectively. If these were random samples, would you think that female college basketball players are typically taller than female college field hockey players? Explain your decision using answers to the previous questions and/or additional analysis.

College Athletes – Rubric

Name: _____ Date: _____

NJSLS: 7.SP.3; 7.SP.4

Type: _____ Teacher: _____

Task Description	- Clearly constructs and communicates a complete response based on concrete referents provided in the prompt or constructed by the student such as diagrams that are connected to a written (symbolic) method, number line diagrams or coordinate plane diagrams. - Clearly constructs and communicates a complete response by ➤ using a logical approach based on a conjecture and/or stated assumptions ➤ providing an efficient and logical progression of steps ➤ using grade-level vocabulary, symbols, and labels ➤ providing a justification of a conclusion with minor computational error ➤ evaluating, interpreting and critiquing the validity and efficiency of others' responses				
Command Level Description	<i>Level 5:</i> <i>Distinguished Command</i> Perform the task items accurately or with minor computation errors.	<i>Level 4:</i> <i>Strong Command</i> Perform the task items with some non-conceptual errors	<i>Level 3:</i> <i>Moderate Command</i> Perform the task items with minor conceptual errors and some computation errors.	<i>Level 2:</i> <i>Partial Command</i> Perform the task items with some errors on both math concept and computation.	<i>Level 1:</i> <i>No Command</i> Perform the task items with serious errors on both math concept and computation.
Score range	<i>11-12 pts</i>	<i>8-10 pts</i>	<i>5-7 pts</i>	<i>2-4 pts</i>	<i>0-1 pts</i>
Task Score & PLD Assigned					

College Athletes – Rubric

NAME: _____

#	Answer	Scoring
Part A	The center of the basketball distribution is much higher on the number line than the center of the field hockey distribution, so at first glance, it appears that the basketball group has the higher average. Similarly, the values for the basketball distribution appear to have a greater range and are less concentrated than the field hockey distribution, so it appears that the basketball group has greater variability in its observations.	1 point for correctly identifying higher average 1 point for correctly identifying the greater variability 2 TOTAL POINTS
Part B	Field Hockey: mean = 64.76, MAD = 1.75; Basketball: mean = 72.5, MAD = 3.58. These values do support the conjectures from Part (a).	2 points for correctly finding the mean of both teams 2 points for the correctly finding the MAD of both teams 1 point for stating that it supports observations in Part A 5 TOTAL POINTS
Part C	The tallest field hockey player is 70 inches. Four of the basketball players are less than 70 inches (65, 67, 68, and 69).	1 point for the correct statement 1 TOTAL POINTS
Part D	At 65 inches, she is more likely to be a field hockey player. Using the summary measures, 65 inches is approximately the mean for the field hockey players, so she would be a field hockey player of average height. A height of 65 inches is more unusual for the basketball team as that value is just over 2 MAD's below the mean. When using the raw data, there are only 4 athletes who are 65 inches tall, and 3 of them are field hockey players (75%) while only 1 of them is a basketball player (25%).	1 point for the correct response 1 point for the appropriate reasoning 2 TOTAL POINTS
Part E	Yes, it appears that women's college basketball players are typically taller than women's college field hockey players. In addition to any arguments/statements made earlier regarding the dot plots and summary measures, one could also mention that 23 of the basket players are taller than the tallest field hockey player (and similar comparative arguments).	1 point for the correct response 1 point for the appropriate reasoning 2 TOTAL POINTS

7th Grade Portfolio Assessment: Unit 4 Performance Task 2

Name _____

Block _____

Date _____

Rolling Dice (7.SP.6)

Roll two dice 10 times. After each roll, note whether any sixes were observed and record your results in the table below.

Roll	Any Sixes? (Y/N)
1	
2	
3	
4	
5	
6	
7	
8	
9	
10	

- What fraction of the 10 rolls resulted in at least one six?
- Combine your results with those of your classmates. What fraction of all the rolls in the class resulted in at least one six?
- Make a list of all the different possible outcomes that might be observed when two dice are rolled. (Hint: There are 36 different possible outcomes.)
- What fraction of the 36 possible outcomes result in at least one six?
- Suppose you and your classmates were able to roll the two dice many thousands of times. What fraction of the time would you expect to roll at least one six?

IX. Modifications

Special Education/ 504:	English Language Learners:
-Adhere to all modifications and health concerns stated in each IEP. -Give students a MENU options, allowing students to pick assignments from different levels based on difficulty. -Accommodate Instructional Strategies: reading aloud text, graphic organizers, one-on-one instruction, class website (Google Classroom), handouts, definition list with visuals, extended time -Allow students to demonstrate understanding of a problem by drawing the picture of the answer and then explaining the reasoning orally and/or writing , such as Read-Draw-Write -Provide breaks between tasks, use positive reinforcement, use proximity -Assure students have experiences that are on the Concrete- Pictorial- Abstract spectrum by using manipulatives -Implement supports for students with disabilities (click here) - Make use of strategies imbedded within lessons -Common Core Approach to Differentiate Instruction: Students with Disabilities (pg 17-18) - Strategies for students with 504 plans	- Use manipulatives to promote conceptual understanding and enhance vocabulary usage - Provide graphic representations, gestures, drawings, equations, realia, and pictures during all segments of instruction - During i-Ready lessons, click on “Español” to hear specific words in Spanish - Utilize graphic organizers which are concrete, pictorial ways of constructing knowledge and organizing information - Use sentence frames and questioning strategies so that students will explain their thinking/ process of how to solve word problems - Utilize program translations (if available) for L1/ L2 students - Reword questions in simpler language - Make use of the ELL Mathematical Language Routines (click here for additional information) -Scaffolding instruction for ELL Learners -Common Core Approach to Differentiate Instruction: Students with Disabilities (pg 16-17)
Gifted and Talented:	Students at Risk for Failure:
- Elevated contextual complexity - Inquiry based or open ended assignments and projects - More time to study concepts with greater depth - Promote the synthesis of concepts and making real world connections - Provide students with enrichment practice that are imbedded in the curriculum such as: • Application / Conceptual Development • Are you ready for more? - Provide opportunities for math competitions - Alternative instruction pathways available - Common Core Approach to Differentiate Instruction: Students with Disabilities (pg. 20)	- Assure students have experiences that are on the Concrete- Pictorial- Abstract spectrum - Modify Instructional Strategies, reading aloud text, graphic organizers, one-on-one instruction, class website (Google Classroom), inclusion of more visuals and manipulatives, Peer Support - Constant parental/ guardian contact - Provide academic contracts to students & guardians - Create an interactive notebook with samples, key vocabulary words, student goals/ objectives. - Plan to address students at risk in your learning tasks, instructions, and directions. Anticipate where the needs will be, then address them prior to lessons. -Common Core Approach to Differentiate Instruction: Students with Disabilities (pg 19)

21st Century Life and Career Skills:

Career Ready Practices describe the career-ready skills that all educators in all content areas should seek to develop in their students. They are practices that have been linked to increase college, career, and life success. Career Ready Practices should be taught and reinforced in all career exploration and preparation programs with increasingly higher levels of complexity and expectation as a student advances through a program of study.

|---|---|

Students are given an opportunity to communicate with peers effectively, clearly, and with the use of technical language. They are encouraged to reason through experiences that promote critical thinking and emphasize the importance of perseverance. Students are exposed to various mediums of technology, such as digital learning, calculators, and educational websites.

Technology Standards:

All students will be prepared to meet the challenge of a dynamic global society in which they participate, contribute, achieve, and flourish through universal access to people, information, and ideas.

<https://www.state.nj.us/education/cccs/2014/tech/>

8.1 Educational Technology:

All students will use digital tools to access, manage, evaluate, and synthesize information in order to solve problems individually and collaborate and to create and communicate knowledge.

A. **Technology Operations and Concepts:**

Students demonstrate a sound understanding of technology concepts, systems and operations.

B. **Creativity and Innovation:** Students demonstrate creative thinking, construct knowledge and develop innovative products and process using technology.

C. **Communication and Collaboration:** Students use digital media and environments to communicate and work collaboratively, including at a distance, to support individual learning and contribute to the learning of others.

D. **Digital Citizenship:** Students understand human, cultural, and societal issues related to technology and practice legal and ethical behavior.

E. **Research and Information Fluency:** Students apply digital tools to gather, evaluate, and use of information.

F. **Critical thinking, problem solving, and decision making:** Students use critical thinking skills to plan and conduct research, manage projects, solve problems, and make informed decisions using appropriate digital tools and resources.

8.2 Technology Education, Engineering, Design, and Computational Thinking - Programming:

All students will develop an understanding of the nature and impact of technology, engineering, technological design, computational thinking and the designed world as they relate to the individual, global society, and the environment.

A. **The Nature of Technology: Creativity and Innovation-** Technology systems impact every aspect of the world in which we live.

B. **Technology and Society:** Knowledge and understanding of human, cultural, and societal values are fundamental when designing technological systems and products in the global society.

C. **Design:** The design process is a systematic approach to solving problems.

D. **Abilities in a Technological World:** The designed world in a product of a design process that provides the means to convert resources into products and systems.

E. **Computational Thinking: Programming-** Computational thinking builds and enhances problem solving, allowing students to move beyond using knowledge to creating knowledge.

Interdisciplinary Connections:

English Language Arts:

L.7.3

Use knowledge of language and its conventions when writing, speaking, reading, or listening.

SL.7.1

Engage effectively in a range of collaborative discussions (one-on-one, in groups, and teacher-led) with diverse partners on grade 7 topics, texts, and issues, building on others' ideas and expressing their own clearly.

W.7.1

Write arguments to support claims with clear reasons and relevant evidence.

5 Practices for Orchestrating Productive Mathematics Discussions

Anticipate

Consider how students might mathematically interpret a problem, the array of strategies—both correct and incorrect—that they might use to tackle it, and how those strategies and interpretations might relate to the mathematical concepts, representations, procedures, and practices that you would like the students to learn.

- Solve the problem yourself first. If possible work with colleagues.
- Ask yourself the following questions:
 - What strategies have students used in the past?
 - What representations are students most likely to use?
 - What incorrect or unproductive strategies are students likely to try?
 - What things might get in the way of students being able to engage with the problem? How can you remove those barriers?
 - What questions will you ask those who struggle?

Monitor

Pay close attention to students' mathematical thinking and solution strategies as they work on the task.

- Create a list of strategies the students may produce.
- Circulate the room. Watch and listen to students as they work.
- If any students use strategies you anticipated, write their name or group number on your list.
- Ask questions that will help students make their thinking visible.
- Ask questions that will help students clarify their thinking.
- Press students to consider aspects of the task to which they need to attend.

Select

Select particular students to share their work with the rest of the class to get specific mathematics into the open for discussion. The selection of particular students and their solutions is guided by the previously anticipated strategies and your assessment of how each approach will contribute to that goal.

- Based on the previously anticipated strategies and the mathematical goal of the activity, decide which student strategies to highlight.
- Select students who will share their work with the class.

Sequence

Make purposeful choices about the order in which students' work is shared to maximize the chances of achieving the mathematical goals for the discussion.

- Based on the mathematical goal, decide on the purpose for the sequence of work. For example: least efficient to most efficient, concrete to abstract, misconceptions to conceptions, or building representations.
- Decide in which order students will present their work.

Connect

Help students draw connections between their solutions and other students' solutions as well as the key mathematical ideas in the lesson. Help students to make judgments about the consequences of different approaches for the range of problems that can be solved, one's likely accuracy and efficiency in solving them, and the kinds of mathematical patterns that can be most easily discerned. Know where you want the discussion to "land" and make choices that are likely to get you there. If necessary, you may have to demonstrate an approach that students didn't come up with themselves.

- As students share, ask questions to elicit and clarify student thinking.
- After each student shares, ask questions to connect it to previously shared work or ask a student to summarize what another student said in their own words.
- Ask students to compare and contrast strategies or representations during the discussion.
- If students did not come up with an approach that you need them to see in order for the discussion to "land," demonstrate this approach and connect it to the work that students did.

IDEAL MATH BLOCK
