

ADDING FRACTIONS

- You will need some paper!

Fractions

- The top number is the numerator
- The bottom number is the denominator
- Example: 2 numerator
5 denominator

A fraction can also look like this $\frac{2}{5}$ with the 2 as the numerator and the 5 the denominator.

To add fractions with the same denominator

- Keep the common denominator and add the numerator.
- Example: $\frac{2}{5} + \frac{1}{5} = \frac{3}{5}$
- Example: $\frac{4}{10} + \frac{3}{10} = \frac{7}{10}$

- Notice that the denominator does not change, you only add the numerator!

Try some!!!

■ 1.) $\frac{1}{3} + \frac{1}{3} =$

■ 5.) $\frac{24}{50} + \frac{20}{50} =$

■ 2.) $\frac{3}{8} + \frac{4}{8} =$

■ 6.) $\frac{6}{13} + \frac{6}{13} =$

■ 3.) $\frac{1}{10} + \frac{6}{10} =$

■ 7.) $\frac{2}{45} + \frac{12}{45} =$

■ 4.) $\frac{1}{5} + \frac{2}{5} =$

■ 8.) $\frac{8}{90} + \frac{15}{90} =$

Check Your Work

■ $2/3$

■ $49/50$

■ $7/8$

■ $12/13$

■ $7/10$

■ $14/45$

■ $3/5$

■ $23/90$

Adding fractions with different denominators is a little different

- You must first change the fraction before you can add fractions.
- The fractions must have the same denominators to add them.
- For example: If you have a pie cut in two pieces and a pie cut into four pieces the pieces are not the same.

☐ You can not compare a $\frac{1}{2}$ of pie to a $\frac{1}{4}$ of pie.

☐ You must make the pies equal by making them both 4 pieces.

☐ If you multiply the fraction $\frac{1}{2}$ by 2 you will get $\frac{2}{4}$

☐ Example: $\frac{1}{2} \times \frac{2}{2} = \frac{2}{4}$

☐ So, $\frac{1}{2}$ is the same as $\frac{2}{4}$

Making common denominators

- To make common denominators you must find the smallest multiple (least common multiple) of the two denominators
- Example:
 - $\frac{2}{3}$ and $\frac{4}{5}$ the least common multiple of 3 and 5 is 15. 15 would be the common denominator.
 - $\frac{7}{8}$ and $\frac{1}{4}$ the least common multiple is 8.

Lets try to find smallest common multiples

- 1.) $1/5$ and $3/4$ a) 5 b) 20 c) 8
- 2.) $2/7$ and $4/5$ a) 7 b) 15 c) 35
- 3.) $1/3$ and $4/6$ a) 6 b) 12 c) 18
- 4.) $1/2$ and $4/9$ a) 18 b) 9 c) 3
- 5.) $3/8$ and $1/2$ a) 2 b) 8 c) 16

How did you do?

- 1.) $\frac{1}{5}$ and $\frac{3}{4}$ b) 20
- 2.) $\frac{2}{7}$ and $\frac{4}{5}$ c) 35
- 3.) $\frac{1}{3}$ and $\frac{4}{6}$ a) 6
- 4.) $\frac{1}{2}$ and $\frac{4}{9}$ a) 18
- 5.) $\frac{3}{8}$ and $\frac{1}{2}$ b) 8

Changing the fractions to add

- Once you have found the common denominator, you have to change the numerator so that the fraction remains equal.
- Example:
 - $1/4 + 2/3$ = the common denominator is 12.
 - You must multiply the 4 by 3 to equal 12 and the 3 by 4 to equal 12. When multiplying the denominator you must also multiply the numerator by the same number to keep the fraction equal.

Some Examples

■ $1/4 + 2/3 =$

■ Change the fractions so that they have common denominators.

■ $1 \times 3 = 3 \quad 2 \times 4 = 8$
 $\frac{1}{4} \times \frac{3}{3} = \frac{3}{12} \quad \frac{2}{3} \times \frac{4}{4} = \frac{8}{12}$

■ The two new fractions are 3/12 and 8/12

Now it's time to add!

- Now that you have changed the fractions to have the same denominator, it is time to add the fractions.
- You do not add the denominators. That number stays the same. You add the numerators and keep the common denominator.
- Example:
$$\frac{3}{12} + \frac{8}{12} = \frac{11}{12}$$

Try adding fractions

■ 1.) $\frac{2}{3} + \frac{1}{5}$

■ 2.) $\frac{4}{9} + \frac{1}{3}$

■ 3.) $\frac{3}{7} + \frac{1}{3}$

■ 4.) $\frac{1}{2} + \frac{3}{8}$

■ 5.) $\frac{3}{8} + \frac{1}{4}$

Check your answers

■ 1.) $13/15$

■ 2.) $7/9$

■ 3.) $16/21$

■ 4.) $7/8$

■ 5.) $5/8$

Nice Work!!!
