| Gas Law Word Problem                                                          | EXAMPLE                                                                         | A sample of nitrogen collected in a laboratory occupies a volume of 725 mL at a pressure of 0.971 atm. What volume will the gas occupy at a pressure of 1.40 atm, assuming the temperature remains constant? |
|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| List all known variables (P, V, T or n) in this problem                       | $V_1 = 725 \text{ mL}$<br>$P_1 = 0.971 \text{ atm}$<br>$P_2 = 1.40 \text{ atm}$ | 3 SF                                                                                                                                                                                                         |
| List the unknown variable in this problem.                                    | "What volume will the gas occupy?"<br>$V_2 = ?$                                 |                                                                                                                                                                                                              |
| Write the name and formula of the appropriate Gas Law                         | Boyle's Law applies for these variables<br>$P_1 V_1 = P_2 V_2$                  |                                                                                                                                                                                                              |
| Set up the gas law formula to solve for the unknown variable                  | $P_1 V_1 = P_2 V_2$                                                             |                                                                                                                                                                                                              |
| Fill in gas law formula with known quantities and solve for unknown variable. | $V_2 = \frac{(0.971 \text{ atm})(725 \text{ mL})}{(1.40 \text{ atm})}$          |                                                                                                                                                                                                              |
| Final Answer is... (check your work)                                          | $V_2 = 503 \text{ mL}$                                                          | 3 SF                                                                                                                                                                                                         |

| <b>EXAMPLE</b><br>At standard temperature and pressure, a gas occupies a volume of 1.84 L. How many moles of this gas are present at STP? | $V = 1.84 \text{ L @ STP}$                              | "How many moles of this gas are present at STP?"<br>$n = ?$ | Avogadro's Law<br>applies for these variables<br>1 mole of any gas @ STP = 22.4 L | N/A - no equation, a simple dimensional analysis conversion<br>$1.84 \text{ L} \div 22.4 \text{ L} = 0.082142857 \text{ moles}$ | $1.84 \text{ L} \div 22.4 \text{ L} = 0.082142857 \text{ moles}$              | $n = 0.0821 \text{ moles}$<br>(Answer has 3 SF b/c you start w/ 3 SF)<br>3 SF |
| What volume (in Liters) will 0.524 moles of Nitrogen ( $\text{N}_2$ ) occupy at STP?                                                      | $n = 0.524 \text{ moles @ STP}$                         | $V = ? \text{ L}$                                           | Avogadro's Law<br>applies for these variables<br>1 mole of any gas @ STP = 22.4 L | N/A - no equation, a simple dimensional analysis conversion                                                                     | $0.524 \text{ moles} \times 22.4 \text{ L} = 11.7376 \text{ L}$               | $V = 11.7 \text{ L}$                                                          |

| Gas Law Word Problem                                                                                                            | List all known variables (P, V, T or n) in this problem                            | List the unknown variable in this problem | Write the name and formula of the appropriate Gas Law                             | Set up the gas law formula to solve for the unknown variable | Fill in gas law formula with known quantities and solve for unknown variable                            | Final Answer is... (check your work!) |
|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|-------------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|---------------------------------------|
| A chemist produces 0.712 moles of H <sub>2</sub> S during a reaction. At STP, what volume in Liters will this gas occupy at STP | n = 0.712 moles<br>@ STP                                                           | V = ? L                                   | Avogadro's Law applies for these variables<br><br>1 mole of any gas @STP = 22.4 L | N/A - no equation, a simple dimensional analysis conversion  | $\frac{0.712 \text{ mol}}{1 \text{ mol}} \times 22.4 \text{ L}$<br>= 15.9488 L                          | V = 15.9 L                            |
| A sample of gas occupies a volume of 681 Liters at STP. How many moles of this gas are present at STP?                          | V = 681 L<br>@ STP                                                                 | # moles = ?                               | Avogadro's<br><br>1 mole = 22.4 L                                                 | N/A - no equation, a simple dimensional analysis conversion  | $\frac{681 \text{ L}}{22.4 \text{ L}} \times 1 \text{ mole}$<br>= 30.40178...                           | n = 30.4 moles                        |
| 5.00 L of gas is known to contain 0.965 mol. If the amount of gas is increased to 1.80 mol, what volume will the gas occupy?    | V <sub>1</sub> = 5.00 L<br>n <sub>1</sub> = 0.965 mol<br>n <sub>2</sub> = 1.80 mol | V <sub>2</sub> = ?                        | Avogadro's<br><br>$\frac{V_1}{n_1} = \frac{V_2}{n_2}$                             | $V_2 = \frac{n_2 \cdot V_1}{n_1}$                            | $V_2 = \frac{(1.80 \text{ mol}) \cdot 5.00 \text{ L}}{0.965 \text{ mol}}$<br>V <sub>2</sub> = 9.326.... | V <sub>2</sub> = 9.33 L               |

- What does the "STP" abbreviation represent? Standard Temperature + Pressure
- What is standard temperature in degrees Celcius? Kelvin? 0°C, 273 K
- What is standard atmospheric pressure in atm? kPa? mmHg? 101.325 kPa, 760 mmHg
- What is molar volume? 1 mole = 22.4 L @ STP
