

PRO or **CON** (circle one)

In your small group of like-minded individuals, you will need to EACH have ONE thing to say during the discussion.

Using your RESEARCH document from yesterday, pick a few points that support your opinion to discuss with your small group. Decide which are the most important and compelling facts and ideas, and assign one to each group member to share during the full discussion. Don't worry if another small group shares your opinion and also finds and shares the same fact before you get a chance to; you can still share your thoughts to get your points.

Name:	What they will contribute to the discussion:
Daisy	Some cons being huge capital cost, possibility of accidents, the burden of radioactive waste and more.
Jocelyn	Although we have said that nuclear meltdowns are extremely rare, it's not a 100% guarantee that accidents cannot occur
Ahmya	Building a nuclear power plant is extremely expensive
Atia	There is always a possibility of accidents. Under the extreme conditions, who is to say events of chernobyl and fukushima will not repeat
Amia	While some of these are decommissioning old nuclear plants and do not have new capacity coming up, some countries are phasing out nuclear power and switching to renewables w

Now that THAT is worked out, use this group time to practice saying out loud to a small group what you will need to say later during the whole group discussion; ask for help with pronunciation; and ask any clarifying questions you may have.
