Chapter 5 AP Statistics Practice Test

Section I: Multiple Choice Select the best answer for each question.

(a) 10 (b) 9 (c) 6 (d) 7 (a) 6

15.1. Dr. State plana to tess a fair coin 10,000 times in the PROBABILITY ONLY TELLS US hope that it will lead him to a deeper understanding of the WHAT HAPPENS APPROXIMATELY laws of probability. Which of the following statements is true? IN THE LONG RUN, NOT (a) It is unlikely that Dr. Stats will get more than 5000 heads. (b) Whenever Dr. Stats gets a string of 15 tails in a row, it WHAT WILL HAPPEN IN becomes more likely that the next toss will be a head. SHORT RUN. (c) The fraction of tosses resulting in heads should be close to 1/2, (d) The chance that the 100th tom will be a head depends somewhat on the results of the first 99 tosses. (c) All of the above statements are true. T5.2. China has 1.2 billion people. Marketers want to know which international bunds they have heard of. A large study showed that 62% of all Chinese adults have heard of Coca-Cola. You want to simulate choosing a Chinese at YOU NEED EXACTLY 62 OF THE random and arking if he or the has heard of Coca-Cola. One correct way to assign random digits to simulate the answer in 2-DIGIT NUMBERS TO 100 (a) One digit simulates one person's answer; odd means REPRESENT THE EVENT "Yes" and even means "No" "HAUING HEARD OF COKE (b) One digit simulates one person's answer, 0 to 6 mean "Yes" and 7 to 9 mean "No. (c) One digit simulates the result; 0 to 9 tells how many in the sample said "Yes." it) Two digits simulate one person's answer 00 to 61 mean 13% Tes" and 62 to 99 mean "No. Two digits simulate one person's answer, 00 to 62 mean "Yes" and 63 to 99 mean "No." T5.3. Choose an American household at random and record the number of vehicles they own. Here is the probability mod-P(MORE THAN 2) =, 137, 05 +, 02 = , 20 20% el if we ignore the few households that own more than 5 catt Number of care: 2 5 0.05 0.02 Probability: 0.09 0.36 0.35 0.13 A housing company builds houses with two-car garages. What percent of households have more cars than the garage can hold? (b) 13% ((c) 20% (d): 45% (e) 55% (a) 7% T5.4. Computer voice recognition software is getting better. Some companies claim that their software correctly recognizes 98% of all words apoken by a trained user. In simulate recognizing a single word when the probability of being correct is 0.98, let two digits simulate one word; 00 to 97 mean "correct." The program recognizes words (or not) independently. To simulate the program's performance on 10 words, use these random digits 9 out o \$ 10 Current abto total 1708 1041 61790 99656 87964 18883 The number of words recognized correctly out of the 10 is

Quantions T5.5 to T5.7 refer to the following setting. Que thousand students at a city high school were classified according to both GPA and whether or not they contintently skipped classes. The two-way table below summarizes the data.

	GPA		
Skipped Classes	<2.0 2.0-0.0	>3.0	
Many	6 3	()=110	
Fair	255 450	205 1000	15 (255)

- 1. The probability of flipping four coins and getting four "heads" is 1
 - (a) Interpret this probability

```
THE PROPORTION OF TIMES ALL 4 COINS WOULD
COME UP "HEADS" WOULD BE ABOUT 1/16.
```

(b) You flip four coins 32 times. Are you guaranteed to get four "heads" twice? Explain.

[NO] WHILE WE CAN PREDICT THE PROPORTION OF TIMES WE GET 4 HEADS IN THE LONG RUN, IN THE SHORT RUN THAT PROPORTION IS UNPREDICTABLE.

2. You are playing a board game with some friends in which each turn begins with rolling two dice. In this game, rolling "doubles"—the same number on both dice—is especially beneficial. You've rolled doubles on your last three turns, and one of your friends says, "No way you'll roll doubles this time, it would be nearly impossible." Explain to your friend what he doesn't seem to understand about probability

SINCE DICE ROLLS ARE INDEPENDENT, PREJIOUS ROLLS HAVE NO IMPACT ON THE PROSA BILITY OF THE NEXT ROLL. ONLY IN THE VERY LUNG RUN CAN BE CONFIDENT THAT THE PROPORTION OF DOUBLES WILL APPROACH THE EXPECTED VALUE.

3. A school's debate club has 10 members, 6 females and 4 males. If the team decides to pick two members randomly to participate in a debate, what is the probability that both of the chosen members are female? We want to use simulation to estimate this probability Describe the simulation procedure below, then use the random number table on the next page to carry out 10 trials of your simulation and estimate the probability Mark on or above each line of the table so that someone can clearly follow your method.

 ASSIGN THE DIGITS O TO 5 (ORI-C) TO FEMALES AND 6 TO 9 (7-9,0) TO MALES
 CHOOSE & NUMBERS FROM THE REMOON DIGIT TRALE, IGNORING REPEATS.

The Practice of Statistics, 4/e- Chapter 5

209

Ouiz 5.2B

1. The table below is a probability model for the number of cars in a randomly-selected household in the United States. (Based on U.S. Census 2000 data).

Number of cars	0	1	2	3	4	5 or more
Probability	0.07	0.19	0.47	. 19 ?	0.06	0.02

(a) What is the probability that a randomly selected household has three cars? (That is, fill in the space marked with a "?") Show your work.

ALL THE PROBABLE TIES MUST ADD TO 1. P(3 cars) = 1 -. 07 -. 19 -. 47 -. 06 -. 02 = (19

(b) What is the probability that a randomly-selected household has at least 2 cars? Show your work.

- 2. Last Saturday at Pasquale's Pizzas and Wings 60 customers were served over the course of the evening. Fifty-two customers ordered pizza and 16 ordered buffalo wings. Twelve of these customers ordered both pizza and wings. Suppose we select a customer from last Saturday at random.
 - (a) Fill in the Venn diagram below so that it describes the chance process involved here. Let P = the event "ordered pizza" and W = the event "ordered wings."

© 2011 BFW Publishers

214

(b) What is the probability that a randomly-chosen customer did not order wings or pizza? Justify you answer with appropriate calculations.

$$P(\text{Neither Wings or Pizza}) = I - P(\text{Wings or Pizza}) = I - (\frac{52}{60} + \frac{11}{60} - \frac{12}{60}) = I - (\frac{52}{60} + \frac{11}{60} - \frac{12}{60}) = I - \frac{51}{60}$$

$$= I - \frac{51}{60}$$

$$= I - \frac{51}{60}$$

The table below gives the counts (in thousands) of earned degrees in the United States in a
recent year, classified by level and by the gender of the degree recipient.

	Degree (thousands)					
[Bachelor's	Master's	Professional	Doctoral	Total	
Female	616	194	30	16	856	
Male	529	171	44	26	770	
Total	1145	365	74	42	1626	

Suppose one degree recipient from this group is selected randomly

- (a) List two mutually exclusive events for this chance process.
 - (2) Any pair of degree types
- (b) What is the probability that the person selected earned a Master's degree?

(c)What is the probability that the person selected earned a Professional or Doctoral degree?

(d) What is the probability that the person selected is female or earned a Master's degree?

$$P(\text{femile or Mosters}) = \frac{856}{1626} + \frac{365}{1626} - \frac{194}{1626}$$

Quiz 5.3B

 What age groups use social networking sites? A recent study produced the following data about 768 individuals who were asked their age and which of three social networking sites they used most often. (People who did not use such sites were excluded from the study).

		Age Grou	ap (Years)		
Web site	0 - 24	25 - 44	45 - 64	Over 65	Totals
Facebook	77	105	114	12	308
Twitter	46	110	(81)	7	244
LinkedIn	15	97	95	9	216
Totals	138	312	(290)	28	768

Suppose one subject from this study was selected at random.

(a) I ind the probability that the selected subject preferred Twitter.

P (TWITTER) = 244 768 = 318

- (b) Find the probability that the selected subject preferred Twitter, given that he or she was in the
 - 45 64 age group.

220

(c) Are the events "preferred Twitter" and "age group 45-64" independent? Explain.

NO (from probabilities found in a+b) P(Twitter) = P(Twitter | 45-64) 1318 = .279

- (d) Are the events "preferred Twitter" and "age group 45 64" mutually exclusive? Explain.
 - No There are 81 individuals that prefer Twitter and are between 45-64.

That is, the occurrence of ane event does not The Practice of Statistics, the Chapter 5 02011 BFW Publishers prectude the occurrence of the other. That is P(Twitter A 45-64 = 0) (e) If a random sample of two subjects were selected, what is the probability that neither preferred Twitter?

P (NOT TWITTER A NOT TWITTER) = 524 . 523 767 .465

P(+witer) = 244 768

,172

2. Some days, Ramon drives to work. The rest of the time he rides his bike. Suppose we choose a random work day The following table gives the probabilities of several events.

Event	Probability P(D)
Drives to work	0.20
Drives and is late for work	0 05 - P(D n L)
Late for work, given he bikes	0 30 - P(L B)

(a) Find the probability that Ramon is late for work, given that he drives.

$$P(LATE | DRIVES) = \frac{P(LATE and Drives)}{P(Drives)} = \frac{.05}{.20} = .75$$
(b) Find the probability that Ramon is not late for work, given that he drives.

$$P(NOT LATE | DRIVES) = \frac{P(NOT LATE and Drives)}{P(Drives)} = \frac{.15}{.20} = .75$$
(c) Draw a tree diagram to summarize the given probabilities and those you determined above.

$$\frac{.25(\frac{.20}{.20})}{.20} Late = .05$$
(c) Drives
$$\frac{.20}{.20} Drives \frac{.20}{.20} Late = .05$$
(c) Drives
$$\frac{.20}{.20} Drives \frac{.20}{.20} Late = .24$$
(c) Drives
$$\frac{.20}{.20} Drives \frac{.20}{.20} Late = .24$$

(d) Find the probability that Ramon drove to work, given that he is late. $P(DROUE | LATE) = \frac{P(DROUE \text{ ond } Late)}{P(LATE)} = \frac{.05}{.05+.24}$
