Lesson 9.3a Day 1- Significance Test for µ

The level of dissolved oxygen (DO) in a stream or river is an important indicator of the water's ability to support aquatic life. A researcher measures the DO level at 30 randomly chosen locations along a stream. Here are the results in milligrams per liter (mg/l): $\bar{x} = 4.77$ and $s_x = 0.939$. An average dissolved oxygen level below 5 mg/l puts aquatic life at risk. Do the data provide convincing evidence at the α = 0.05 significance level that aquatic life in this stream is at risk?

What are the sample mean and ample standard deviation (using correct notations)?

2. State the appropriate hypotheses for a significance test. Be sure to define the parameter of interest.

M= TRUE MEAN DO LEVEL Ho: M=5 HA: 14 45 (FISH LIFE AT RISK)

3. What conditions must be met? Check them.

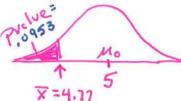

- Randomly chosen locations - 10%: n=304 to (all locations)

under Ho

4. Give the formulas for the mean and standard deviation of the sampling distribution of \bar{x} and calculate the values.

$$G_{\overline{X}} = \frac{G}{\sqrt{n}} \simeq \frac{S_{X}}{\sqrt{n}} = \frac{0.939}{\sqrt{30}} = 0.1714$$

5. Draw a picture and then calculate the test statistic. Remember, since we are working with means, 1 sample t-Lest for u the test statistic is a t value

$$\pm = \frac{\overline{X} - \mu}{s_{x/10}} = \frac{4.77 - 5}{0.939/30} = -1.34$$

Find the P-value for your test statistic

Prolue = P(+ <-1.34) = .0953 (tcdf(-0,-1.34, 29)

14=30-1=29 Pg:1

Puclue = 0.0953

7. What is the interpretation of the p-value?

ASSUMING THE MEAN DO LEVEL IS 5 mg/L, there is a .095 Probability of getting a sample mean of 4.77 mg/L OR LESS Purely by Chance.

8. What conclusion can we make?

Since the prolve (.095) is greater than d=0.05, We foil to reject the. We do not have Convincing evidence the mean Do Level is less than 5 mg/L.

Example #2 "Construction zones"

Every road has one at some point—construction zones that have much lower speed limits. To see if drivers obey these lower speed limits, a police officer used a radar gun to measure the speed (in miles per hour, or mph) of a random sample of 10 drivers in a 25 mph construction zone. Here are the results:

27

33

32

30

27

34

- (a) Can we conclude that the average speed of drivers in this construction zone is greater than the posted 25 mph speed limit?
- · Parameter of Interest: M = TRUE MEAN SPEED OF DRIVERS IN A

25 MPH CONSTRUCTION ZONE

Null Hypothesis:

Ho: U= 25 (POSTED SPEED LINIT)

Alternative Hypothesis:

HA: M725 (ARE DRIVERS SPEEDING)

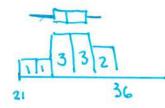

- Level of Significance: $\sqrt{=.05}$

Test Statistic (clearly show calculation)

• P-value (Use correct probability notation.) Pralue = P (+7 3.05)= .0069

• (Conclusions (decision in context)
	Since the prolue (.0069) IS LESS THAN 0=.05
	We Reject Ho.
	WE HAVE CONVINCING EVIDENCE THE MEAN
	DRIVING SPEED IS GREATER THAN 25 MPh IN
	CONSTRUCTION ZONES.
	Given your conclusion in part (a), which kind of mistake—a Type I or a Type II error—could you have
mae	de? Explain what this mistake means in this context.

SINCE WE	REJECTED HO, WE MAY HAVE
MADE A T	YPEI ERROR.
MISTAKE:	IT IS POSSIBLE THAT WE CONCLUDED THE AVERAGE SPEED WAS MURE
	THAN 25 mph, WHEN IN FACT
	THE AVERAGE SPEED IS 25 MPh.
	A POSSIBLE CONSEQUENCE IS MORE
	POLICE ARE HIRED WASTING
	TAX PAYERS MONEY

Example #3 "Don't break the ice" 2-Sided Test of Significance for Means

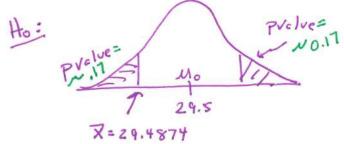

In the children's game Don't Break the Ice, small plastic ice cubes are squeezed into a square frame. Each child takes turns tapping out a cube of "ice" with a plastic hammer hoping that the remaining cubes don't collapse. For the game to work correctly, the cubes must be big enough so that they hold each other in place in the plastic frame but not so big that they are too difficult to tap out. The machine that produces the plastic ice cubes is designed to make cubes that are 29.5 millimeters (mm) wide, but the actual width varies a little. To make sure the machine is working well, a supervisor inspects a random sample of 50 cubes every hour and measures their width. The Fathom output below summarizes the data from a sample taken during one hour.

	29.4874 mm Med	20
	50 🔥	
	0.0934676 mm 52	
	0.0132183 mm 5E	
Width	29.2717 mm MIN	
	29.4225 mm 01	
	29.4821 mm mel	010
	29.5544 mm 4 3	
	29.7148 mm MA	A
S1 = mean ()	_	
S2 = count ()		
S3 = stdDev()	ブ	
S4 = stdError ()		
S5 = min()		
S6 = Q1 ()	1	
S7 = median ()	Key	
S8 = Q3()		

- a) Do these data give convincing evidence that the mean width of cubes produced this hour is not 29.5 mm?
 - · Parameter of Interest M = TRUE MEAN WIDTH OF PLASTIC ICE CUBES
 - Ho: M = 29,5 Null Hypothesis
 - Alternative Hypothesis Ha: LL = 29.5

 - Choice of Test 1 SAMPLE t-test for un (means)
 - Conditions of Test (assume conditions have been met) 585, CLT, 10%
 - Sampling Distribution (Sample statistics and sketch of the sampling distribution of the sample statistic under the null hypothesis, indicating the mean)

$$X = 29.4874$$
 $S_X = .093 \longrightarrow SE = 0.132183$
 $N = 50 \longrightarrow df = 49$

• Test Statistic (clearly show calculation)

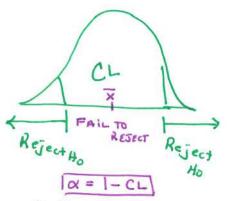

• P-value (Use correct probability notation.) PVALUE = 2. P(± 4 -0.948) = .3428

Conclusions (in context)

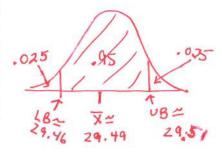

SINCE THE PUALUE (13428) IS GREATER THAN & =.05 WE FAIL TO REJECT HO, WE DO NOT HAVE CONVINCING EVIDENCE THE TRUE MEAN WIDTH OF PLASTIC ICE CUBE IS DIFFERENT THAN 29.5 MM.

Example #4 "Don't break the ice" Confidence intervals for Means

Here is computer output for a 95% confidence interval for the true mean width of plastic ice cubes produced this hour.

mm
m

Problem:

Pg:6

a) Interpret the confidence interval. Would you make the same conclusion with the confidence interval as you did with the significance test in the previous example?

TEE CUBES IS IN THE INTERVAL 29.46 TO 29.51mm.

A 95% CI IS EQUIVALENT TO A TOHW/d=.05

SINCE THE INTERVAL [29.46, 29.51] CONTAINS 29.5mm AS A
PLAUSIBLE VALUE FUR THE TRUE MEAN WIDTH ICE CUBE, WE WOULD
MAKE THE SAME DECISION TO FAIL TO REJECT HO

b) [REVIEW QUESTION] Interpret the confidence level.

THE PRODUCTION MACHINE WILL RESULT IN AN INTERVAL THAT CAPTURES THE TRUE MEAN WIDTH OF PLASTIC ICE CUBES

c) [REVIEW QUESTION] Interpret the standard deviation and the standard error provided by the computer output.

SD=0.093 SE=0.013 X= Z9.49 N=50

S.D. -> THE WIDTHS OF THE ICE CUBES HRE ABOUT 0,093 mm From THE MEAN WIDTH OF 29.49mm, ON AVERAGE.

S.E. - IN RANDOM SAMPLES OF SIZE 50, THE SAMPLE MEAN WILL BE ABOUT 0.013 mm FROM THE TRUE MEAN, ON AVERAGE.
