All About Atoms

Directions:

Go to **Chem4Kids.com** and select the green "**Atoms**" choice. "**Atom Basics**" is located on the right side of the page as a map of the specific area of the website just for Atoms. As you read each page, starting on the "**Atoms Around Us**" overview page, please <u>fill in the blanks</u> listed below. The missing words can be found in order of the web pages. Be sure to select the green "**Next Page on Atoms**" at the bottom of each page to help you navigate the website successfully.

- 1. Elements are the alphabet in the language of molecules.
- 2. Atoms are the general term used to describe pieces of matter.
- Molecules are groups of atoms <u>bonded</u> together in the same way that words are groups of letters.
- 4. While the atoms have different <u>masses</u> and organization for each element, they are all built with the same parts. Electrons, protons, and neutrons
- 5. Atoms are the foundation of chemistry.
- 6. <u>Electrons</u> are the smallest of the three particles that make up atoms.
- 7. Electrons are found in shells or <u>orbitals</u> that surround the nucleus of an atom.
- 8. Protons and neutrons are found in the nucleus.
- 9. The <u>atomic</u> number is also called the proton number.
- 10. The <u>electron</u> always has a "-", or negative, charge. The <u>proton</u> always has a "+", or positive, charge.
- 11. The third particle is the neutron. It has a <u>neutral</u> charge, also known as a charge of zero.
- 12. Since the number of protons in an atom does not change, fewer or extra electrons can create a special atom called an <u>ion</u>. <u>Cations</u> have fewer electrons and have a positive charge. <u>Anions</u> have extra electrons that create a negative charge.

- 13. <u>Electrons</u> are always moving. They spin very quickly around the nucleus of an <u>atom</u>. As the electrons zip around, they can move in any direction, as long as they stay in their <u>shell</u>.
- 14. Electrons are found in areas called shells. A shell is sometimes called an <u>energy</u> <u>level</u>.
- 15. Each of those shells has a name (K, L, M, N, O, P, Q). The "K" shell is the one closest to the nucleus, and "Q" is the farthest away.
- 16. The K shell only holds <u>two</u> electrons. The L shell only holds <u>eight</u> electrons. The M shell only holds <u>eight</u> electrons. The M shell can actually hold up to <u>18</u> electrons as you move to higher atomic numbers. The maximum number of electrons you will find in any shell is <u>32</u>.
- 17. Electrons play a major role in all chemical bonds.
- 18. There is one type of bonding called <u>electrovalent</u> bonding (<u>ionic</u>), where an electron from one atom is transferred to another atom.
- 19. The second type of bonding is called <u>covalent</u> bonding, where electrons are actually shared between two or more atoms in a cloud.
- 20. Whenever an atom has full shells, we say it is "happy".
- 21. Your whole goal as an atom was to become a "happy atom" with completely filled electron shells.
- 22. Neutrons play a major role in the mass and radioactive properties of atoms.

 <u>Isotopes</u> are created when you change the normal number of <u>neutrons</u> in an atom.
- 23. We have already learned that <u>ions</u> are atoms that are either missing or have extra <u>electrons</u>. Let's say an atom is missing or has an extra neutron. That type of atom is called an isotope.
- 24. <u>Molecule</u> is the general term used to describe any atoms that are connected by chemical bonds.
- 25. Every combination of atoms is a <u>molecule</u>. A <u>compound</u> is a molecule made of atoms from <u>different</u> elements. All compounds are molecules, but not all molecules are compounds.
