

Unit 1: Introductory Lesson 1 – Variables and Expressions

Objective:

to write algebraic expressions for word phrases

Vocabulary:

	Definition	Examples
Variable	A <u>letter</u> used to represent a <u>Quantity</u>	x, y, r
Numerical Expression	Contains only <u>numbers</u> and <u>operations</u>	$5 + 7$
Variable Expression	May contain <u>numbers</u> , <u>operations</u> , and one or more <u>variables</u>	$3x + 1$

Example 1: Identify each expression as a numerical expression or a variable expression. For a variable expression, name the variable.

- a) $5 - 5$ b) $c - 5$ c) $8 \div x + 9$ d) $100 \cdot 6$

numerical

variable; c

variable; x

numerical

Example 2: List possible clue words that would tell you to complete each of the following:

Addition	Subtraction	Multiplication	Division	Parentheses
add	subtract	multiply	divide	sum of
plus	minus	times	quotient	difference
sum	difference	product	groups	of
increase	decrease	of	split	quantity
more than	less than	per	per	
together	take away			
total	less			

"than" → sends it to the end

Example 3: Select the BEST way to write each expression.

- a) The product of a and 5

- $a \times 5$
- $a5$
- $5 \times a$
- $5a$

- b) The quotient of 3 and x

- $3 \div x$
- $\frac{3}{x}$
- $x \div 3$
- $\frac{x}{3}$

Unit 1: Introductory Lesson 1 – Variables and Expressions

Example 4: Complete the table below.

Word Phrase	Variable Expression
Nine <i>more than</i> a number y	$y + 9$
4 <i>less than</i> a number n	$n - 4$
A number z <i>times</i> three	$3z$
A number a <i>divided by</i> 12	$\frac{a}{12}$
5 <i>times the quantity</i> 4 <i>plus</i> a number c	$5(4+c)$

Example 5: Write a variable expression for each word phrase.

- a) 16 more than m $m + 16$
- b) the product of c and 3 $3c$
- c) b times 8 $8b$
- d) x less than 2 $2 - x$
- e) 4 more than the quotient of g and 6 $\frac{g}{6} + 4$
- f) 10 less than the quotient of a number c and 13 $\frac{c}{13} - 10$
- g) 9 less than 18 times a number x $18x - 9$
- h) 6 times the sum of a number q and 9 $6(q+9)$
- i) one fifth of the sum of 10 and a number q $\frac{1}{5}(10+q)$
- j) 12 times the quotient of a number g and 43 $12(\frac{g}{43})$
- k) 6 less than the product of t and 7 $7t - 6$

Example 6: Write a variable expression to represent the situation.

- a) number of hours in m minutes $\frac{m}{60}$
- b) cost of p pens priced at \$0.29 each $.29p$
