

# Lesson 3.3

Use Arrays and  
Partial Products  
to Multiply

MULTIPLY

**When you hear multiplication, give one word that comes to mind.**

① Start presenting to display the poll results on this slide.

# STANDARD: NC.4.NBT.5

- Multiply a whole number of up to three digits by a one-digit whole number.
- Multiply up to two two-digit numbers with place value understanding using area models, partial products, and the properties of operations.
- Use models to make connections and develop the algorithm.

# I CAN STATEMENT & ESSENTIAL QUESTION

I can use use arrays and partial products to multiply.

MULTIPLY

How can you use use arrays and partial products to multiply?

# Mathematics Objective:

MULTIPLY

Today we will use arrays and partial products to multiply 2- and 3-digit numbers by 1-digit numbers.

## Using an Array to find Partial Products

This video shows you how to  
use an array to find partial  
products.

# Partial Products

Partial products are explained in the video.

# Vocabulary:

MULTIPLY

multiply	the result of repeated additions of equal groups.
factor	the numbers that are multiplied together to make a product.
product	the answer to a multiplication problem.
multiple	the product of a given number and any nonzero whole number (factor).
array	A way of displaying objects in rows and columns.

# Vocabulary:

MULTIPLY

numerical expression	an expression that contains numbers and at least one operation.
equation	<p>A number sentence that uses the equal sign (=) to show that two expressions have the same value.</p> <p>Example: <math>9 + 3 = 12</math></p>
area model	a rectangle used to model multiplication and division of whole numbers.
partial product	Products found by breaking one factor in a multiplication problem into ones, tens, hundreds, and so on, and then multiplying each of these by the other factor.

# Vocabulary:

MULTIPLY

commutative property of multiplication	factors can be multiplied in <u>any order</u> and the product stays the same. Example: $3 \times 200$ or $200 \times 3$
associative property of multiplication	factors can be <u>regrouped</u> and the product stays the same. Example: $3 \times (2 \times 100)$ or $(3 \times 2) \times 100$
distributive property of multiplication	multiplying a sum (or difference) by a number is the same as multiplying each number in the sum (or difference) by that number and adding (or subtracting) the products.  Example: $(3 \times 21) = (3 \times 20) + (3 \times 1)$

# Vocabulary:

MULTIPLY

identity property  
of multiplication

The product of any number and one is that number.

Example:  $1 \times 200 = 200$  or  $1,000 \times 1 = 1,000$

zero property of  
multiplication

The product of any number and zero is zero.

Examples:  $3 \times 0 = 0$ ;  $5 \times 0 = 0$

# Example #1

Target just displayed 13 cans of lemon-mango juice on 3 shelves, forming an array. How many total cans are there?

- Build the array to create the expression!

You could count all of the cans in this ARRAY, one by one. You could also use the traditional algorithm to multiply  $3 \times 13$ .  
Let's look at another way. Go on to see!

Let's move the cans into two groups. The first has 3 rows with 10 objects in each row. The second has 3 rows with 3 objects in each row. We still have 3 rows with 13 objects in each row, just like before but we can use this to multiply two digit numbers mentally!

We broke the array apart to multiply!

Instead of  $3 \times 13$ , we multiplied

$$3 \times 10 = 30 \quad \text{and} \quad 3 \times 3 = 9$$

$$30 + 9 = 39$$

## Example #2

With larger numbers you can use manipulatives. Find  $144 \times 2$ ?

- Use your manipulatives to build the expression.!

1 flat=100, 1 rod=10, and 1 square unit=1. To multiply  $144 \times 2$  we break it apart  $(100 + 40 + 4) \times 2$

$$100 \times 2 = 200$$

$$40 \times 2 = 80$$

$$4 \times 2 = 8$$

200

80

+ 8

288

# Distributive Property

Multiplying a sum (or difference) by a number is the same as multiplying each number in the sum (or difference) by that number and adding (or subtracting) the products.

This is an example of distributive property. We broke it apart and distribute the 2 to each addend!  $(100 + 40 + 4) \times 2$

$$100 \times 2 = 200$$

$$40 \times 2 = 80$$

$$4 \times 2 = 8$$

$$200 \leftarrow 100 \times 2$$

$$80 \leftarrow 40 \times 2$$

$$+ 8 \leftarrow 4 \times 2$$

$$\underline{200} \\ + 80 \\ + 8 \\ \hline 288$$

# Partial Products

$$\begin{array}{r} 200 \\ 80 \\ + 8 \\ \hline 288 \end{array}$$

←  $100 \times 2$   
←  $40 \times 2$   
←  $4 \times 2$

Products found by breaking **one factor** in a multiplication problem into **ones**, **tens**, **hundreds**, and so on, and then multiplying each of these by the other **factor**  $144 \times 2$

This example follows the same rules as the array. As you can see, we still have 2 rows with 100 objects in it, 2 rows with 40 objects in it, and 2 rows with 4 objects in it. We just didn't draw it out.

$$\begin{array}{rcl} 200 & \longleftarrow & 100 \times 2 \\ 80 & \longleftarrow & 40 \times 2 \\ + \underline{8} & \longleftarrow & 4 \times 2 \\ \hline 288 \end{array}$$

What would an array of  $327 \times 3$  look like?

- Use your manipulatives to show the above expression.

**WORK  
IT OUT**

Break apart using ones, tens, hundreds, and so on....

$$300 \times 3 = 900$$

$$20 \times 3 = 60$$

$$7 \times 3 = 21$$

$$327 \times 3$$

$$900 \leftarrow 300 \times 3$$

$$60 \leftarrow 20 \times 3$$

$$+ 21 \leftarrow 7 \times 3$$

$$981$$

This is an example of distributive property. We broke it apart and distribute the 2 to each addend!  $(100 + 40 + 4) \times 2$

$$100 \times 2 = 200$$

100

100

$$40 \times 2 = 80$$

10 10 10 10

10 10 10 10

$$4 \times 2 = 8$$

200

80

+ 8

288

$$100 \times 2$$

$$40 \times 2$$

$$4 \times 2$$

# PRACTICE

You may already know some of your basic multiplication facts. Use partial product to find the following problems.

$13 \times 4$

$45 \times 6$

$265 \times 3$

$691 \times 2$

The local charity sold plates to help raise money for the 4th grade trip to Disneyland. They only sold plates on Friday, Saturday, and Sunday after 2 pm. Each day they made \$1,692. How much money did they make during these three evenings combined? Use the partial products algorithm to solve.

**PRACTICE**

**PRACTICE**

**PRACTICE**

For your class assignment you will finish  
move to stations...

Lesson 3.3 Practice Buddy

Remember while at your stations to please  
work quietly on your assignments. After the  
timer goes off, quietly rotate to your next  
station!!

When you finish your  
assignment, make sure to go to  
google classroom and submit  
your assignment.

**PRACTICE**

Students, follow the instructions on the slide
