Touch Point Money: Each ● = count by 5s

To count money using touch points, touch each coin at the red dot and count by 5s. When you get to a penny, drag your finger across the penny and count on by 1s.

Place Value

Place Value

Billions			Millions			Thousands			Ones			Decimals		
Hundred Billions	Ten Billions	One Billion	Hundred Millions	Ten Millions	One Million	Hundred Thousands	Ten Thousands	One Thousand	Hundred	Tens	Ones	Tenths	Hundredths	Thousandths

Numbers are grouped in periods or families.

The number families are ones, thousands, millions, billions (and decimals.)

There are three places in each number family: ones, tens, and hundreds.

Numbers can be expressed in 3 different forms:

Standard Form

Numbers written as you would normally see them

7,986,345.62

Word Form

Numbers written in words (as they would be read)

seven million, nine hundred eighty-six thousand, three hundred forty-five, and sixty two hundredths

Expanded Form

Numbers written by adding the value of each number separately.

$7,000,000 + 900,000 + 80,000 + 6,000 + 300 + 40 + 5 + 0.6 + 0.02$

STANDARD FORM

one hundred eighty two

Addition

Count on

Start with the BIGGER number and count on

$$3 + 6 = 9$$

Ashley Dodson 2016

Use a number line

Start with the greater number and count on by jumping to the right

$$4 + 3 = 7$$

Ashley Dodson 2016

Make a ten

Use numbers that make a group of ten to solve

$$8 + 2 = 10$$

Ashley Dodson 2016

Use Tally Marks To Add

$$4 + 2 = 6$$

$$\text{||||} + \text{||} = \text{|||||}$$

Make tally marks for each number.
How many altogether?

© Whimsy Workshop Teaching.com 2016

Use a Ten Frame To Add

$$2 + 4 = 6$$

Fill the ten frame with dots
for both numbers.
How many altogether?

© Whimsy Workshop Teaching.com 2016

Add : Commutative Rule

If $2 + 1 = 3$ Then $1 + 2 = 3$

You can add numbers
in any order.

© Whimsy Workshop Teaching.com 2016

Adding With Doubles

$$2 + 2 = 4$$

Add the same number
two times.

© Whimsy Workshop Teaching.com 2016

Use a Ten Frame To Add

$$2 + 4 = 6$$

Fill the ten frame with dots
for both numbers.
How many altogether?

© Whimsy Workshop Teaching.com 2016

Add with Part Part Whole

$$2 + 1 = 3$$

Add two parts together.
The answer equals the whole.

© Whimsy Workshop Teaching.com 2016

Count On To Add

$$3 + 2 = 5$$

Start on the first number. (3)
Count forward as many as the
second number. (2)
What number are you on? (5)

© Whimsy Workshop Teaching.com 2016

Add with Friends of Ten

$$\begin{array}{l} 10 + 0 = 10 \\ 9 + 1 = 10 \\ 8 + 2 = 10 \\ 7 + 3 = 10 \end{array} \quad \begin{array}{l} 6 + 4 = 10 \\ 5 + 5 = 10 \\ 4 + 6 = 10 \\ 3 + 7 = 10 \end{array} \quad \begin{array}{l} 2 + 8 = 10 \\ 1 + 9 = 10 \\ 0 + 10 = 10 \end{array}$$

Think about which two
numbers equal ten.

© Whimsy Workshop Teaching.com 2016

Add Doubles Plus 1

$$2 + 2 + 1 = 5$$

Start with a double. ($2 + 2 = 4$)
Then add one more. ($4 + 1$)
How many altogether? (5)

© Whimsy Workshop Teaching.com 2016

Draw A Picture To Add

$$2 + 1 = 3$$

Draw how many you start with. (2)
Draw how many more are added. (1)
How many altogether? (3)

© Whimsy Workshop Teaching.com 2016

Double Digit Addition

WITH regrouping!

Tens

Ones

Carry the one!

4

2

+

3

7

Start,
Start,
Start on
the right!

$$\begin{array}{r} 1 \\ + 4 \\ 2 \\ \hline 7 \end{array}$$

7

0

$$\begin{array}{r} 3 \\ + 7 \\ \hline 10 \end{array}$$

Addition Strategies

Expanded Form:

$$116 + 118 = (100 + 10 + 6) + (100 + 10 + 8)$$

$$100 + 100 = 200$$

$$10 + 10 = 20$$

$$6 + 8 = 14$$

$$200 + 20 + 14 = 234$$

Making Friendly Numbers:

$$116 + 118$$

$$+2$$

$$116 + 120 = 236$$

$$236 - 2 = 234$$

Addition Strategies

Compensation:

$$116 + 118$$

$$\begin{array}{r} \text{a. } 116 \quad 118 \\ -2 \quad +2 \\ \hline 114 + 120 = 234 \end{array}$$

$$\begin{array}{r} \text{b. } 116 \quad 118 \\ +4 \quad -4 \\ \hline 120 + 114 = 234 \end{array}$$

Making Tens:

$$116 + 118$$

$$\begin{array}{l} \text{a. } (110 + 4 + 2) + (110 + 8) \\ 110 + 110 + (2 + 8) + 4 \\ 230 + 4 = 234 \end{array}$$

$$\begin{array}{l} \text{b. } (110 + 6) + (110 + 4 + 4) \\ 110 + 110 + (6 + 4) + 4 \\ 110 + 110 + 10 + 4 = 234 \end{array}$$

Standard Algorithm:

$$116 + 118$$

$$\begin{array}{r} \text{Step 3: Add the hundreds} \\ 100 + 100 = 200 \end{array}$$

$$\begin{array}{r} \text{Step 2: Add the tens} \\ 10 + 10 + 10 = 30 \end{array}$$

$$\begin{array}{r} \text{Step 1: Add the ones} \\ 6 + 8 = 14 \text{ (Regroup? Yes!)} \end{array}$$

$$\begin{array}{r} \text{Step 4: } 200 + 30 + 4 = 234 \end{array}$$

Subtraction

Count back

Start with the BIGGER number and count backwards

$$7 - 3 = 4$$

Ashley Dodson 2016

Use a number line

Start with the greater number and count back by jumping to the left

$$8 - 2 = 6$$

Ashley Dodson 2016

Make a ten

Use groups of ten to solve.
Think: 3 plus what is 10?

I know 3 plus 7 is 10, so 10 minus 3 is 7.

$$10 - 3 = 7$$

Ashley Dodson 2016

Double Digit Subtraction

Line up your **tens** and **ones**!
Start, Start, Start on the right!

$$\begin{array}{r}
 \text{Tens} \qquad \text{Ones} \\
 5 \quad 2 \\
 - \quad 3 \\
 \hline
 \end{array}$$

MORE on TOP, NO need to Stop!

$$\begin{array}{r}
 7 \quad 5 \\
 - \quad 3 \\
 \hline
 \end{array}$$

7 is circled with a dashed line.

Double Digit Subtraction

WITH regrouping!
Line up your **tens** and **ones**!
Start, Start, Start on the right!

$$\begin{array}{r}
 \text{Tens} \qquad \text{Ones} \\
 5 \quad 2 \\
 - \quad 3 \\
 \hline
 \end{array}$$

MORE on the FLOOR, Go next door and get 10 more!

$$\begin{array}{r}
 12 \quad 4 \\
 - \quad 3 \\
 \hline
 \end{array}$$

4 is circled with a dashed line.

$$\begin{array}{r}
 12 \\
 - 4 \\
 \hline
 8
 \end{array}$$

$$\begin{array}{r}
 5 \\
 - 2 \\
 \hline
 3
 \end{array}$$

Subtraction Strategies

Place Value:

$$223 - 159$$

200	20	3
100	50	9

Step 1: Subtract the ones (3 - 9)
Can you do it? If not, take 10 from the tens in the same number

Step 2: Subtract the tens (10 - 50)
Can you do it? If not, take 100 from the hundreds in the same number

Step 3: Subtract the hundreds (100 - 100) = 0

Step 4: Add the ones, tens, and hundreds

$$60 + 4 = 64$$

Add Up or Count Back:

$$123 - 59$$

Subtraction Strategies

Adjusting One Number:

$$123 - 59$$

$$\begin{array}{r} 123 \\ - 59 + 1 = \\ \hline 63 + 1 = 64 \end{array}$$

$$\begin{array}{r} 123 + 6 = 129 \\ - 59 \\ \hline 70 - 6 = 64 \end{array}$$

Keeping a Constant Difference:

$$\begin{array}{r} 123 + 1 = 124 \\ - 59 + 1 = - 60 \\ \hline 64 \end{array}$$

Standard Algorithm:

$$\begin{array}{r} 223 - 159 \\ \hline 100 - 100 = 0 \end{array}$$

Step 3: Subtract the hundreds

$$\begin{array}{r} 223 \\ - 159 \\ \hline 64 \end{array}$$

Step 4: 60 + 4 = 64

Step 1: Subtract the ones
13 - 9 = 4 (Regroup? Yes!)

Step 2: Subtract the tens
110 - 50 = 60 (Regroup? Yes!)

Rounding

ROUNDING

Picture the rounding rollercoaster to help you determine how to round a number. Numbers 0, 1, 2, 3, and 4 don't make it up the hill so the number stays the same. Numbers 5, 6, 7, 8, and 9 make it up and over the hill so the number rounds up one digit.

WEAK
NUMBER STAYS

STRONG
NUMBER ROUNDS UP

ROUNDING

- Rounding is used when the exact number isn't needed.
- Rounding makes the number easier to understand and work with.

FOR EXAMPLE

Round the cost of each item below to quickly and easily add up the numbers. The answer will give a rough idea what the total bill will be at the checkout.

Round the prices to the nearest ten

Game \$28	Candy \$11	Hat \$17
		
\rightarrow \$30	\rightarrow \$10	\rightarrow \$20
\downarrow	\downarrow	\downarrow
\$30	+	\$10
	+	\$20

It will approximately cost = \$60

The result is less accurate, but still gives a good idea how much money is needed to pay for all of the items.

ROUNDING

- Step 1.** Underline the place being rounded.
- Step 2.** Look to the number next door.
- Step 3.**

If the number is **4** or **lower**, keep the underlined number the **SAME**.

If the number is **5** or **higher**, **RAISE** the underlined number.

- Step 4.** Change all of the numbers in the place value positions after the underlined digit to zero.

EXAMPLE

Round 3,432 to the nearest ten.

Step 1. 3,432

Step 2. Look next door - 3,432

- Step 3. 2 is lower than 4, so the underlined number will stay the **same**.
- Step 4. Change all the numbers after the underlined digit with a zero **3,430**.

ROUNDING

Mrs J's Resource Creations ©

0, 1, 2, 3, 4 fingers lifted are able to hold on to the balloon and keep it at the same level.

Lift finger number 5 and the balloon will be released and rise into the air.

0 – 4 Stays the Same

5 or More Goes up

Rounding Numbers

- Rounding to the nearest tens place -

1. Underline the place value being rounded

Round to the nearest ten place:

244

2. Look at the number to the RIGHT next door

Round to the nearest ten place:

244

3. If the number to the RIGHT is 4 or less, just ignore

Round to the nearest ten place:

244 → 240

Rounding Numbers

- Rounding to the nearest tens place -

4. If the number to the RIGHT is 5 or more, add 1 more to the underlined number

Round to the nearest ten place:

247 → 250

5. Change all the numbers to the right of the underlined number to zeros

Round to the nearest ten place:

244 → 240

Round to the nearest ten place:

247 → 250

Rounding Numbers

- Rounding to the nearest hundreds place -

1. Underline the place value being rounded

Round to the nearest hundred place:

244

2. Look at the number to the RIGHT next door

Round to the nearest hundred place:

244

3. If the number to the RIGHT is 4 or less, just ignore

Round to the nearest hundred place:

244 → 200

Rounding Numbers

- Rounding to the nearest hundreds place -

4. If the number to the RIGHT is 5 or more, add 1 more to the underlined number

Round to the nearest hundred place:

267 → 300

5. Change all the numbers to the right of the underlined number to zeros

Round to the nearest hundred place:

244 → 200

Round to the nearest hundred place:

267 → 300

Rounding Rules

0-4

Do no more!

Ex: $7\textcircled{4}3 = 700$
 $2,5\textcircled{2}7 = 2,500$

5-9

Climb the vine!

Ex: $7\textcircled{6}3 = 800$
 $2,5\textcircled{9}7 = 2,600$

 $12 \times 10 = 120$
 $12 \times 11 = 132$
 $12 \times 12 = 144$

Associative Property

$$20 \times 30 =$$

$$(20 \times 3) \times 10 =$$

$$60 \times 10 =$$

$$600$$

Place Value

$$20 \times 30 =$$

$$20 \times 3 \text{ tens} =$$

$$60 \text{ tens} =$$

$$600$$

Halve then Double

$$20 \times 30 =$$

$$10 \times 30 = 300$$

$$10 \times 30 = 300$$

$$300 + 300 = 600$$

Number Line

$$20 \times 9 =$$

Estimate Products-Round

$$32 \rightarrow 30$$

$$31 \rightarrow 30$$

$$900$$

Estimate Products-Compatible Numbers

$$26 \rightarrow 25$$

$$48 \rightarrow 50$$

$$1,250$$

Area Model

Partial Product

$$\begin{array}{r} 40 \times 20 = 800 \\ 40 \times 5 = 200 \\ 3 \times 20 = 60 \\ 3 \times 5 = 15 \\ + 15 \\ \hline 1,075 \end{array}$$

Regrouping Method

$$\begin{array}{r} 43 \\ \times 25 \\ \hline 215 \\ + 860 \\ \hline 1,075 \end{array}$$

AREA MODEL FOR MULTIPLICATION

1. Expand each number

$$\begin{array}{r} 36 \rightarrow 30 + 6 \\ \times 25 \rightarrow 20 + 5 \\ \hline \end{array}$$

2. Set up numbers and multiply

\times	30	+	6
20	$20 \times 30 =$ 600		$20 \times 6 =$ 120
+			
5	$5 \times 30 =$ 150		$5 \times 6 =$ 30

2. Add the products for the answer

$$\begin{array}{r} 600 \\ 120 \\ 150 \\ + 30 \\ \hline 900 \end{array}$$

PARTIAL PRODUCTS

$$182 \rightarrow 100 + 80 + 2$$

1 hundred 8 tens 2 ones

$$\times 26$$

$$6 \times 2 \rightarrow 12$$

$$6 \times 80 \rightarrow 480$$

$$6 \times 100 \rightarrow 600$$

$$20 \times 2 \rightarrow 40$$

$$20 \times 80 \rightarrow 1600$$

$$20 \times 100 \rightarrow 2000$$

$$+ 2000$$

$$4732$$

1. Multiply 6 by each digit in 182
2. Multiply 20 by each digit in 182
3. Find the partial products
4. Add to find the product

THE AREA MODEL

This is a box model for a two-digit number times a two-digit number.

Step 1 Write your multiplication problem.

$$\begin{array}{r} 58 \\ \times 45 \\ \hline \end{array}$$

Step 2 Write an addition problem using the tens and the ones value of the top number.

$$\begin{array}{r} 58 \\ \times 45 \\ \hline \end{array} \quad 50 + 8$$

Step 3 Draw a box model starting with a vertical line under the addition sign and write the 2nd addition problem using the tens and the ones value of the bottom number.

$$\begin{array}{r} 58 \\ \times 45 \\ \hline \end{array} \quad \begin{array}{r} 50 + 8 \\ 40 \\ + \\ 5 \end{array} \quad \begin{array}{|c|c|} \hline & \\ \hline & \\ \hline \end{array}$$

Step 4 Multiply: 40×50 and write the answer inside the 1st box; 40×8 and write the answer in the 2nd box; 5×50 and write the answer in the 3rd box; 5×8 and write the answer in the 4th box.

$$\begin{array}{r} 58 \\ \times 45 \\ \hline \end{array} \quad \begin{array}{r} 50 + 8 \\ 40 \\ + \\ 5 \end{array} \quad \begin{array}{|c|c|} \hline 2000 & 320 \\ \hline 250 & 40 \\ \hline \end{array}$$

Step 5 Add the four boxes together.

$$\begin{array}{r} 2000 \\ 320 \\ 250 \\ + 40 \\ \hline 2610 \end{array}$$

Therefore, the answer is:

2610

Multiplication Algorithm

$$\begin{array}{r} \textcircled{2} 13 \\ \times 57 \\ \hline \end{array}$$

What's 7 x 3? Yes! 21!

$\textcircled{2} \textcircled{1}$

$$\begin{array}{r} + \textcircled{2} 13 \\ \times 57 \\ \hline \end{array}$$

1: What's 7 x 1? Yes! 7!

2: Then add that $\textcircled{2}$

3: 7 x 1 + 2 = $\textcircled{9}$

$$\begin{array}{r} \textcircled{1} 13 \\ \times 57 \\ \hline \end{array}$$

What's 5 x 3? Yes! 15!

$\textcircled{1} \textcircled{5}$

$$\begin{array}{r} + \textcircled{1} 13 \\ \times 57 \\ \hline \\ + \textcircled{6} 5 \\ \hline \end{array}$$

1: What's 5 x 1? Yes! 5!

2: Then add that $\textcircled{1}$

3: 5 x 1 + 1 = $\textcircled{6}$

Now add em up!

YOU DID IT! 😊

Division

Divisibility Rules

Divisible by	Rule	Example	Non - Example
2	If the last digit is even, (2, 4, 6, 8, or 0)	72<u>4</u>	42<u>3</u>
3	If the sum of the digits is divisible by 3	<u>345</u>	<u>317</u>
4	If the last 2 digits are divisible by 4	7<u>12</u>	7<u>10</u>
5	If the number ends with 5 or 0	4<u>5</u>	9<u>2</u>
6	If the number is divisible by BOTH 2 and 3	<u>144</u>	<u>517</u>
7	No Rule	n/a	n/a
8	If the last 3 digits are divisible by 8	3,<u>840</u>	6,<u>428</u>
9	If the sum of the digits is divisible by 9	<u>6,939</u>	<u>6,923</u>
10	If the number ends in 0	7,20<u>0</u>	4,25<u>8</u>

Division Words

Division Symbol \div

Equal sign $=$

Remainder R

Dividend 37
The large number that is being separated into smaller groups.

Divisor 6
The number of groups that the dividend is being separated into.

Quotient 6
The answer. The number of items in each group.

Remainder 1
The number that is left over and does not fit into an equal group.

Division Words

Division Symbol \div

Divisor 6
The number of groups that the dividend is being separated into.

Dividend 42
The large number that is being separated into smaller groups.

Quotient 7
The answer. The number of items in each group.

Remainder 1R
The number that is left over and does not fit into an equal group.

Skip Pattern Count!

This is a great strategy to use when dividing by 2, 3, 5 or 10.

Skip pattern count by the small number stop when you reach the large number.

$$21 \div 3 =$$

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40

Use Related Facts It's A Fact Family

Remember there are 4 members in each family.

When multiplying the greatest number is always the answer.

When dividing the greatest number is always the number you are dividing into smaller groups.

Example:

$7 \times 4 = 28$ $4 \times 7 = 28$

$28 \div 7 = 4$ $28 \div 4 = 7$

Use Multiplication Facts

When you read a division question - ask yourself a multiplication question.

$$21 \div 7 = ?$$

Ask yourself:

$$7 \times ? = 21$$

Make An Array

When dividing make an array to find the answer. The big number tells you the total number in the array or when to stop. The smaller number tells you how many in one row. The answer is how many in one column.

$$\text{Example: } 42 \div 6 =$$

0000000
0000000
0000000
0000000
0000000
0000000
0000000

Nifty Nines

When dividing by 9 remember your 9 addition facts.

Ask yourself "What is the biggest number?" – add one to the tens digit in the biggest number and that is your answer.

$$\begin{array}{l} 27 \div 9 = \\ 2 + 1 = 3 \end{array}$$

$$\begin{array}{l} 45 \div 9 = \\ 4 + 1 = 5 \end{array}$$

Make a Base 10 Model

Make a Base 10 model of the question. *Model* the big number. Then circle the blocks using the small number. The answer is the number of ones to make the groups equal and you may have some leftover.

Example $46 \div 4 =$

Draw A Picture

When dividing make a picture of equal groups to find the answer. The *big number* tells you the total number to put into groups or when to stop. The *small number* tells you how groups to make. The *answer* is how many in one group.

Remember to put one in a group at a time.

Example: $24 \div 6 =$

Use Base Ten Blocks

Use base ten blocks to model the question. *Model* the big number. Then separate the blocks into equal groups – the smaller number tells you how many equal groups. The answer is the number represented in one group. You may have to exchange a ten for ones to make the groups equal and you may have some leftover.

Example $46 \div 4 =$

Long Division Algorithm

$$\begin{array}{r} 0 \\ 2 \overline{)178} \end{array}$$

Does 2 fit into 1? No way, it's too big!
(so we put a "0" above 1 as a placeholder)

$$\begin{array}{r} 08 \\ 2 \overline{)178} \end{array}$$

Does 2 fit into 17? YES! **8** times. $2 \times 8 = 16$
(one more 2 would be too big)

The **8** goes above the last digit in 17.

$$\begin{array}{r} 8 \\ 2 \overline{)178} \\ \underline{-16} \\ 18 \end{array}$$

1:
2:
3:

(To simplify the look of things, let's drop that 0 placeholder since **08 = 8** anyway.)

- 1: Now we multiply **8** x 2.
- 2: Subtract (we get 1 here when we subtract).
- 3: And bring down the **8**.

$$\begin{array}{r} 89 \\ 2 \overline{)178} \\ \underline{-16} \\ 18 \\ \underline{-18} \\ 0 \end{array}$$

Does 2 fit into 18? YES! **9** times. $2 \times 9 = 18$
The **9** goes up top next to **8**.

Now repeat the three steps above.

- 1: Multiply **9** x 2.
- 2: Subtract.
- 3: There's nothing to bring down! We're done!

$$178 \div 2 = 89$$

YOU DID IT! 😊

Does
Divide

McDonald's
Multiply

Serve
Subtract

Cheese
Check

Burgers
Bring down (or up!)

$$\begin{array}{r} 38R0 \\ 2 \overline{) 76} \\ \underline{-6} \\ 16 \\ \underline{-16} \\ 0 \end{array}$$

Suggested language:

- What “2” fact gets you close to “7” without going over? ($2 \times 3 = 6$)
- What “2” fact gets you close to “16” without going over? ($2 \times 8 = 16$)

Partial Quotients Division

$$\begin{array}{r} 133 \text{ R } 3 \\ 4 \overline{) 535} \\ - 400 \\ \hline \end{array}$$

How many groups of 4 we took out total, and the remainder (or leftovers).

$$\begin{array}{r} 135 \\ - 120 \\ \hline \end{array}$$

What is left over after we took out 100 groups of 4.

100

This side shows how many groups of 4 we have taken out each time.

$$\begin{array}{r} 15 \\ - 12 \\ \hline \end{array}$$

30

$$\begin{array}{r} 3 \\ - 3 \\ \hline \end{array}$$

3

3

When we can no longer take out any more groups of 4, we are done subtracting. The number that remains, or is leftover, becomes our remainder.

Big '7' Division

$$489 \div 3$$

	163		
3	489		
-	300	100	x 3
	189		
-	90	30	x 3
	99		
-	90	30	x 3
	9		
-	9	3	x 3
	0		
		163	

Big "I" Division

(Double Digit)

<div style="display: inline-block; text-align: right;"> <div style="color: green; font-weight: bold; font-size: 1.2em;">15</div> <div style="border-left: 1px solid black; padding-left: 5px; margin-left: 5px;"> <div style="border-bottom: 1px solid black; padding-bottom: 5px;">78'40</div> <div style="padding-bottom: 5px;">- 360</div> <div style="border-bottom: 1px solid black; padding-bottom: 5px;">480</div> <div style="padding-bottom: 5px;">- 360</div> <div style="border-bottom: 1px solid black; padding-bottom: 5px;">120</div> <div style="padding-bottom: 5px;">- 75</div> <div style="padding-bottom: 5px;">45</div> <div style="border-bottom: 1px solid black; padding-bottom: 5px;">- 45</div> <div style="padding-bottom: 5px;">0</div> </div> </div>	<div style="border-left: 1px solid black; padding-left: 10px;"> <div style="border-bottom: 1px solid black; padding-bottom: 5px;">24 × 15</div> <div style="padding-bottom: 5px;">24 × 15</div> <div style="padding-bottom: 5px;">5 × 15</div> <div style="padding-bottom: 5px;">+ 3 × 15</div> </div> <div style="margin-top: 10px;">56</div>
--	--

$$\begin{array}{r}
 66000 \\
 - 46000 \\
 \hline
 20000
 \end{array}$$

AREA MODEL FOR DIVISION

This is an area model dividing with a two-digit divisor.

Step 1 Write your division problem.

$$12 \overline{)463} \quad \text{OR} \quad 463 \div 12 = \text{(quotient)}$$

(dividend) (divisor)

Step 2 Draw an open-ended rectangle- leave it open to expand.
Write the divisor number on the left side of the rectangle.
Write the dividend number underneath.

$$\begin{array}{|c|} \hline 12 \\ \hline \\ \hline \end{array} \begin{array}{|c|} \hline \\ \hline \end{array}$$

463

Step 3 Think "What is the highest number I can easily multiply by the divisor with a value less than the dividend?" Write that number on the top of the rectangle. (Hint: Try 100, 50, 20, 10, 5 or 1)

$$\begin{array}{|c|} \hline 20 \\ \hline \end{array} \begin{array}{|c|} \hline 12 \\ \hline \end{array} \begin{array}{|c|} \hline 240 \\ \hline \end{array}$$

463

Thinking box

$$12 \times 20 = 240$$

Step 4 Then subtract the value of your multiplication problem ($20 \times 12 = 240$) from your dividend. Write the value of the subtraction problem under the next box.

$$\begin{array}{|c|} \hline 20 \\ \hline \end{array} \begin{array}{|c|} \hline 12 \\ \hline \end{array} \begin{array}{|c|} \hline 240 \\ \hline \end{array} \begin{array}{|c|} \hline \\ \hline \end{array}$$

463 223

$$\begin{array}{r} - 240 \\ \hline 223 \end{array}$$

Thinking box

$$20 \times 12 = 240$$

Step 5 Think "What is the highest number I can easily multiply by the divisor with a value less than the value of my subtraction problem?" Write that number on top of the next box. Then subtract that answer from 223. Continue.

$$\begin{array}{|c|} \hline 20 \quad 10 \quad 8 \\ \hline \end{array} \begin{array}{|c|} \hline 12 \\ \hline \end{array} \begin{array}{|c|} \hline 240 \\ \hline \end{array} \begin{array}{|c|} \hline 120 \\ \hline \end{array} \begin{array}{|c|} \hline 90 \\ \hline \end{array} \begin{array}{|c|} \hline R7 \\ \hline \end{array}$$

463 223 103

$$\begin{array}{r} - 240 \\ \hline 223 \end{array} \begin{array}{r} - 120 \\ \hline 103 \end{array} \begin{array}{r} - 90 \\ \hline 7 \end{array}$$

Thinking box

$$12 \times 20 = 240$$

$$12 \times 10 = 120$$

$$12 \times 8 = 90$$

Repeat this step until you can't multiply any number by the divisor and it's value is less than the value of your subtraction problem

Step 6 Add the numbers on top of the rectangle. (These are the numbers you multiplied by the divisor.) If there is a remainder, write it next to the value for your answer: **38 R7**

$$20 + 10 + 8 = 38 \text{ R7}$$

Least Common Multiple (LMC) and Greatest Common Factor (GCF)

DIVISIBILITY RULES

A number is divisible by ...	When....	Examples
2	even: last digit is 0, 2, 4, 6, 8	60 98 52
3	sum of digits is divisible by 3	60 75 207
4	can be divided by 2 twice	60 28 108
5	ends in a 0 or 5	60 75 325
6	divisible by both 2 and 3	60 48 162
9	sum of digits is divisible by 9	63 27 711
10	ends in 0	60 90 170
100	ends in two zeros	600 300 2700

91	92	93	94	95	96	97	98	99	100

A prime number is a whole number with only two factors: 1 and itself.

©2017 teacherspayteachers.com/Store/Teaching-Everything

least common multiple

used when comparing 2 numbers

start listing the multiples for both until you find the smallest number they both have in common

Ex: **3** - 3, 6, 9, 12, 15, 18, 21, 24, 27, **30**, 33..
10 - 10, 20, **30**, 40...

greatest common factor (gcf)

used when comparing 2 numbers, or reducing a fraction

Find GCF of...

9/30

find the factors for both numbers

list all the factors and find the biggest number that both have in common.

1, 2, and 4 are common factors, but 8 is the largest.

Once you've found the GCF, divide both numbers by it to reduce your fraction

$$9 \div 3 = 3 \quad 30 \div 3 = 10$$

3/10

7.2 PRIME FACTORIZATION

FACTOR TREES

prime number - a number greater than one and has exactly two factors
1 and itself

Prime numbers are the building blocks of all numbers.

FIND the PRIME FACTORIZATION of 600

Two WAYS to SHOW prime factorization

1. Ladder Diagram

2. Tree Diagram

$$2 \times 2 \times 2 \times 5 \times 3 \times 5$$

Prime Factorization of 600 $\rightarrow 2^3 \times 5^2 \times 3$

Find the Prime Factorization of these numbers.

$$2 \times 2 \times 2 \times 2 \times 2 = 2^5$$

$$2 \times 2 \times 3 \times 11 = 2^2 \times 3 \times 11$$

$$2^4 \times 3^2$$

Decimals

Addition

- > Find the decimal
- > Line up the decimals
- > Fill in empty spots with zero
- > Add
- > Bring down the decimal in your answer

EXAMPLE

Rewritten with decimals lined up...

$$\begin{array}{r} 10.5 + 11.74 \\ + 11.74 \\ \hline 22.24 \end{array}$$

Subtraction

- > Find the decimal
- > Line up the decimals
- > Fill in empty spots with zero
- > Subtract
- > Bring down the decimal in your answer

EXAMPLE

Rewritten with decimals lined up...

$$\begin{array}{r} 12.7 - 9.23 \\ - 9.23 \\ \hline 3.47 \end{array}$$

Rules of Decimals

Multiplication

- > The number with most digits goes on top
- > Decimals do not have to line up
- > Multiply like normal
- > Count how many places in first number the decimal is moved over
- > Count how many places in 2nd number the decimal is moved over
- > This is how many places you move the decimal in your answer

EXAMPLE

$$\begin{array}{r} 1.201 < 3 \text{ DECIMAL PLACES} \\ \times .25 < 2 \text{ DECIMAL PLACES} \\ \hline 6005 \\ 24020 \\ \hline .30025 < 5 \text{ DECIMAL PLACES} \end{array}$$

Division

- > Divisor can not have a decimal
- > Move the divisor decimal so it is a whole number
- > Move the same amount of places in dividend
- > Place a decimal straight up where you write your answer, rewrite problem
- > Divide like normal

EXAMPLE

DIVISOR > 0.3 $\overline{)1.41}$

$$\begin{array}{r} 4.7 \\ 3 \overline{)14.1} \\ -12 \\ \hline 21 \\ -21 \\ \hline 0 \end{array}$$

Dividing with Decimals

3.45 ÷ 3 = 1.15

Step 1: 3 ÷ 3 = 1 (Red arrow and bracket)

Step 2: 4 ÷ 3 = 1 (Green arrow and bracket)

Step 3: 15 ÷ 3 = 5 (Blue arrow and bracket)

Fractions

Adding Fractions

1. Find the LEAST COMMON DENOMINATOR of the two fractions (LCD).

2. Make equivalent fractions.

3. Add the numerators.

4. Keep the denominators the same.

5. Simplify (Reduce).

$$\frac{2}{3} + \frac{2}{5} = \frac{10}{15} + \frac{6}{15} = \frac{16}{15}$$

Common denominators

$1\frac{1}{15}$

SIMPLIFY!

Subtracting Fractions

1. Find the LEAST COMMON DENOMINATOR of the two fractions (LCD).

2. Make equivalent fractions.

3. Subtract the numerators.

4. Keep the denominators the same.

5. Simplify (Reduce).

$$\frac{5}{8} - \frac{1}{4} = \frac{5}{8} - \frac{2}{8} = \frac{3}{8}$$

Common denominators

MULTIPLYING & DIVIDING FRACTIONS

Multiplying

Go straight across!

$$\frac{2}{9} \times \frac{1}{5}$$

$$= \frac{2}{45}$$

*Reduce if possible!

Dividing

Keep Change Flip!
*after you change all
numbers to fraction form*

$$\frac{2}{9} \div \frac{1}{3}$$

*Around the world!

$$\frac{2}{9} \times \frac{4}{3}$$

KCF

$$\frac{2}{9} \times \frac{3}{4}$$

$$\frac{6}{36} = \frac{1}{6}$$

*Reduce if possible!

Fractions

A fraction is a part of a whole number.

PART \longleftrightarrow **NUMERATOR**
WHOLE \longleftrightarrow **DENOMINATOR**

$$\frac{1}{4} = 4 \overline{)1}$$

To convert a fraction to a decimal use long division.

Decimals

A decimal is part of a whole.

A decimal point is used to separate whole numbers from values less than one.

$$0.46 = 46\%$$

To convert a decimal to a percent, move the decimal point two places to the right.

$$\frac{53}{100} = 0.53$$

To convert a decimal to a fraction remove the decimal and write as a fraction (over 100).

Percent

Percents are a ratio of a number to 100.
 They can be written as a decimal or a fraction.

('Per' = for every. 'Cent' = 100.)

$12\% = 0.12$ To convert a percent to a decimal divide by 100 (move the decimal 2 spaces to the left).

To convert a percent into a fraction write the percent divided by 100 and simplify.

$$75\% = \frac{75}{100} \div \frac{25}{25} = \frac{3}{4}$$

$\frac{\%}{100} \times \frac{\text{PART}}{\text{WHOLE}}$

To find the percent of a number multiply the percent with the amount then divide by 100.

What is a **fraction**?

One third of the pizza has been eaten.
Two thirds of the pizza remain.

A fraction is a numerical quantity that is not a whole number.

For single classroom use only, please.

The Number System

© The Illustrated Classroom

What is the **numerator**?

$\frac{2}{3}$ ← The **numerator** is the number above the line in a fraction.

The numerator tells us how many equal parts of the whole are being considered.

For single classroom use only, please.

The Number System

© The Illustrated Classroom

What is the **denominator**?

$\frac{2}{3}$ ← The **denominator** is the number below the line in a fraction.

The denominator tells us how many equal parts make up the whole.

For single classroom use only, please.

The Number System

© The Illustrated Classroom

How do we **divide fractions**?

$$\frac{1}{2} \div \frac{2}{3} = ?$$

RECIPROCAL

$$\frac{1}{2} \div \frac{2}{3} = \frac{1}{2} \times \frac{3}{2} = \frac{3}{4}$$

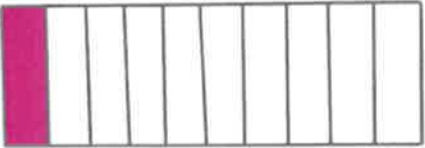

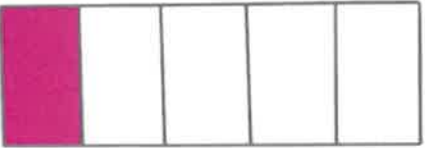

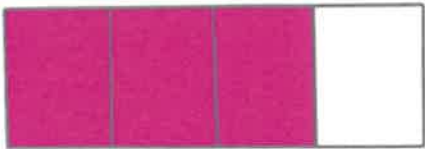

To divide fractions, multiply the first fraction by the reciprocal of the second fraction.

For single classroom use only, please.

The Number System

Misconceptions: Fractions, Decimals & Percentages

Sometimes, it pays to be aware of some common mistakes that students may encounter when learning how about Fractions, Decimals & Percentages.

$$\frac{3}{12} \text{ is simplified}$$

$$\frac{9}{12} \div 2 = \frac{4.5}{6}$$

Student assumes you half in order to simplify. Does not divide by 3 or other possible numbers.

Student thinks that Numerator is total shaded, and Denominator is total unshaded.

$$\frac{1}{5} > \frac{1}{2}$$

Student thinks one fifth is larger than a half. Misunderstands function of Denominator.

$$\frac{3}{4}$$

Student has shaded the Numerator.

$$\frac{3}{4}$$

Student has shaded sum of Numerator & Denominator.

?

Student can find fraction of amount, but does not understand fraction as a number.

$$\frac{1}{5} + \frac{2}{5} = \frac{3}{10}$$

Student has added Numerator & Denominator. Misunderstands function of Denominator.

$$\frac{1}{2} \begin{smallmatrix} +1 \\ +1 \end{smallmatrix} = \frac{2}{3}$$

Student adds 1 to Numerator & Denominator instead of multiplying to find equivalents.

$$0.2 < 0.19$$

Student sees "2" as smaller than "19". Encourage use of extra 0s in spaces.

Student did not multiply by 100. Assumes numbers after decimal point are percentage.

$$0.125 = 125\% \quad 0.5 = 5\%$$

$$\frac{1}{4} = 0.4 \text{ or } 1.4$$

$$\frac{2}{6} = 0.26 \text{ or } 2.6$$

$$\frac{1}{4} = 0.5 \text{ or } 2.6$$

Student may misunderstand the function of the dividing line. Sometimes adds, combines and confuses position of Decimal Point.

Note

There are many more misconceptions, most derive from basic misunderstanding of what a fraction actually is.

What is the least common denominator?

The **LCD** is the smallest number that is divisible by each of the denominators.

The **LCD** of **3** and **6** is **6**

What are **integers**?

integers

All the whole numbers and all the negative numbers are integers. Integers can be positive (1, 2, 3, 4, 5, ...), negative (-1, -2, -3, -4, -5, ...), or zero (0). Fractions are not integers.

For single classroom use only, please.

The Number System

© The Illustrated Classroom

What are **negative numbers**?

NEGATIVE NUMBERS

A negative number is any number with a value less than zero.

For single classroom use only, please.

The Number System

© The Illustrated Classroom

How can I use a number line to determine a **number's opposite**?

The opposite of **4** is **-4**.
The opposite of **-4** is **4**.

A number's opposite is the number that is an equal distance from zero on the opposite side of the number line.

What is a coordinate plane?

A coordinate plane is a plane divided by the x axis and y axis.

For single classroom use only, please.

The Number System

© The Illustrated Classroom

What is an ordered pair?

An ordered pair is a set of two numbers. The first number represents a position on the x axis. The second number represents a position on the y axis. Together, they

How can I check a division problem?

Multiply the **quotient** by the **divisor**, then add the **remainder**.

If the result is the same as the dividend, your answer is correct!

For single classroom use only, please.

The Number System

© The Illustrated Classroom

What is a factor?

$$\underset{\text{FACTOR}}{1} \times \underset{\text{FACTOR}}{12} = \underset{\text{PRODUCT}}{12}$$

$$\underset{\text{FACTOR}}{2} \times \underset{\text{FACTOR}}{6} = \underset{\text{PRODUCT}}{12}$$

$$\underset{\text{FACTOR}}{3} \times \underset{\text{FACTOR}}{4} = \underset{\text{PRODUCT}}{12}$$

Factors are numbers multiplied together.

1, **2**, **3**, **4**, **6**, and **12** are **factors** of **12**

Geometry

Acute Angle

An acute angle is less than 90°

Here are some examples of acute angles:

Straight Angle

A straight angle is exactly 180°

Here are some examples of straight angles:

Right Angle

A right angle is exactly 90°

Here are some examples of right angles:

Reflex Angle

A reflex angle is greater than 180° , but less than 360°

Here are some examples of reflex angles:

Obtuse Angle

An obtuse angle is greater than 90° , but less than 180°

Here are some examples of obtuse angles:

Revolution

A revolution is exactly 360°

Here are some examples of reflex angles:

Right Angle

Measures exactly 90 degrees.

©Cindy Kennedy 2013

Acute Angle

Measures less than 90 degrees.

©Cindy Kennedy 2013

Obtuse Angle

Measures more than 90 degrees but less than 180 degrees.

©Cindy Kennedy 2013

Straight Angle

Measures exactly 180 degrees.

©Cindy Kennedy 2013

Parallel Lines

Lines that will never intersect.

© Kristin Kennedy 2013

Perpendicular Lines

Lines that form square corners.

© Kristin Kennedy 2013

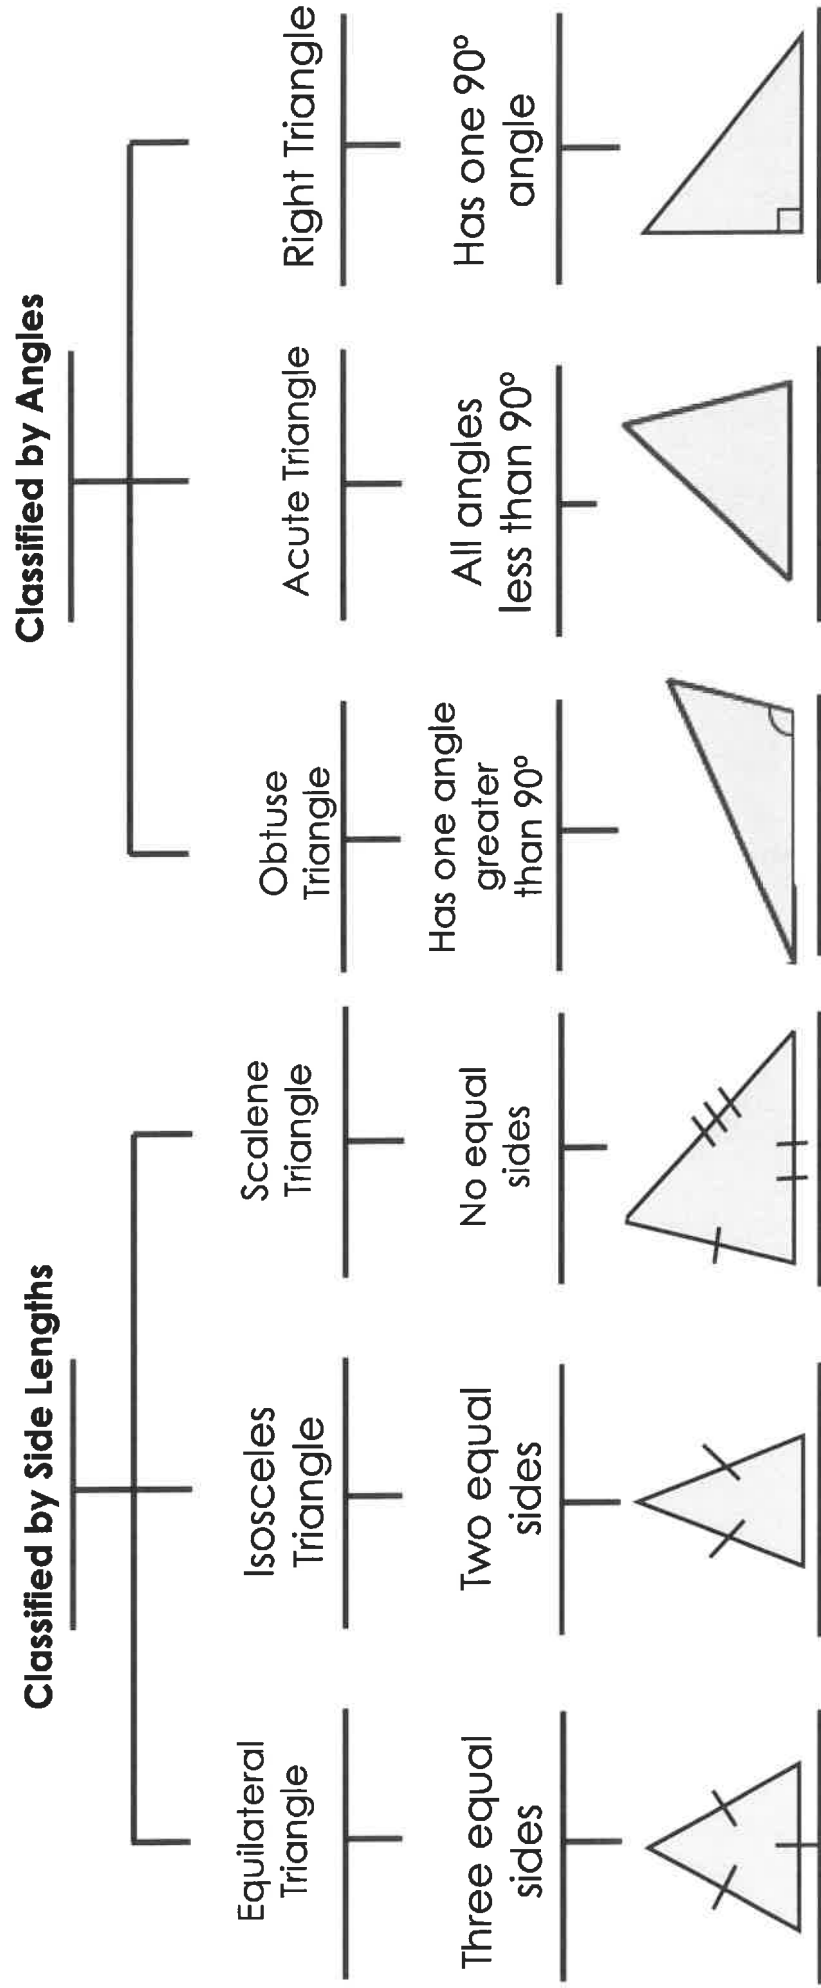

Intersecting Lines

Lines that pass through the same point.

© Kristin Kennedy 2013

Types of Triangles

How to Use a Protractor

A protractor is used to measure the number of degrees in an angle

The symbol for degree is $^{\circ}$

Example:-

45 degrees is 45°

1. Place the centre point of the Protractor on the corner of the angle.
2. Line up the zero line of the Protractor with the bottom line of the angle.
3. Measure the angle that the top line goes through on the Protractor.
4. Well done! You should have your angle measurement!

Review

Well done! You should now know how to measure a basic angle using a protractor!

Fantastic Formulas!

Perimeter: measurement of the distance around an object

$$p = s + s + s + s$$

$$p = 5 + 5 + 5 + 5$$

$$p = 20 \text{ in.}$$

Area: measurement of 2D space inside an object

$$a = l \times w$$

$$a = 3 \times 2$$

$$a = 6 \text{ units}^2$$

Volume: measurement of 3D space inside an object

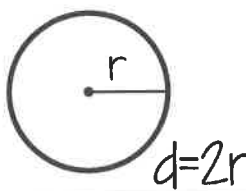

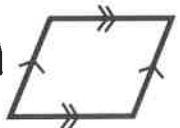

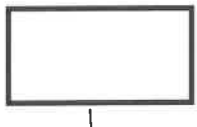

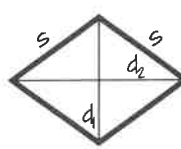

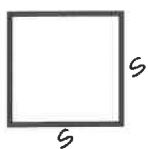

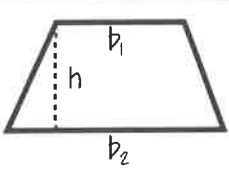

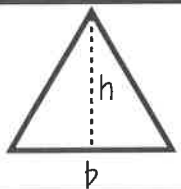

$$v = l \times w \times h$$

$$v = 3 \times 2 \times 4$$

$$v = 24 \text{ meters}^3$$

Area & Perimeter Formulas

Shape	Area	Perimeter
Circle 	$A = \pi r^2$	Circumference $C = \pi d = 2\pi r$
Parallelogram 	$A = b \times h$	$P = 2b + 2s$
Rectangle 	$A = L \times W$	$P = 2L + 2W$
Rhombus 	$A = \frac{(d_1)(d_2)}{2}$	$P = 4s$
Square 	$A = s^2$	$P = 4s$
Trapezoid 	$A = \frac{(b_1 + b_2)h}{2}$	$P = b_1 + b_2 + s_1 + s_2$
Triangle 	$A = \frac{bh}{2}$	$P = s_1 + s_2 + s_3$

How can I find the
area of a rectangle?

w = width
h = height

$$\text{area} = w * h$$

For single classroom
use only, please.

Geometry

© The Illustrated Classroom

How can I find the
area of a triangle?

b = base
h = height

$$\text{area} = \frac{1}{2} * b * h$$

$$\text{area} = \frac{b * h}{2}$$

Note The base and height
must be perpendicular.

For single classroom
use only, please.

Geometry

© The Illustrated Classroom

How can I find the
**area of an
irregular polygon?**

Divide the **polygon** into **triangles**,
rectangles, and **parallelograms**
(a, b, c, ...). Calculate the area of
each and add them together.

For single classroom
use only, please.

Geometry

© The Illustrated Classroom

What is
**coordinate
geometry?**

The point (4,3)
is 4 units right
and 3 units up.

Coordinate geometry is a system of
geometry where the position of points
on a plane is described using an
ordered pair of numbers.

For single classroom
use only, please.
