Muscular System

Course Medical Terminology

Unit IV

Muscular System

Essential Question

What medical terms are associated with the muscular system?

TEKS

130.203 (c) 1A-F 2A-C 3A-C 4A-B

Prior Student Learning

Basic understanding of roots, prefixes and suffixes

Estimated time

4-7 hours

Rationale Healthcare professiona

Healthcare professionals must have a comprehensive medical vocabulary in order to communicate effectively with other health professionals. They should be able to use terminology of the muscular system to discuss common conditions and diseases.

Objectives

Upon completion of this lesson, the student will be able to:

- Define and decipher common terms associated with the muscular system
- Identify the basic anatomy of the muscular system
- Analyze unfamiliar terms using the knowledge of word roots, suffixes and prefixes gained in the course
- Research diseases which involve the muscular system

Engage

Mr. Smith comes into Dr. Jones' office with complaining that his 4-year-old son, Aaron, is having difficultly walking and running without falling. Noticing that Aaron seems behind in his physical growth Dr. Jones orders several tests to see if there is a serious problem.

Key Points

- Muscle terms to know
 - A. My/o muscle
 - B. oblique angled
 - C. Fasci/o fascia
 - D. -lysis breakdown
 - E. Ten/o tendon
 - F. -plegia paralysis
 - G. Kinesi/o movement
 - H. rectus straight
 - I. Ton/o tone
 - J. tansverse crosswise
 - K. Sphincter ring-like
 - L. -cele swelling, hernia, tumor
 - M. -trophy growth or development
 - N. fibr/o fiber, connective tissue
- II. Introduction
 - A. Over 600 muscles make up the muscular system
 - B. 45% of the total body weight of an adult
 - C. Made up of bundles of muscle fibers (long slender cells) held together by connective tissue
 - D. When muscle fibers are stimulated by nerves they contract

		(bec	ome short and thick,) which causes movement
			traction depends on myofilaments: actin and myosin
	F.		perties
		1.	Excitability – the ability to receive and respond to a stimulus
			(neurotransmitter, hormone, local change in pH); the response
			is the generation and transmission of an electrical current
			(action potential)
			a. Skeletal muscle responds to stimulus quickly with forceful
			contraction, and then relaxes promptly
			 b. Visceral muscle responds slowly, maintaining contraction over a longer period of time
			c. Cardiac muscle is quicker than visceral muscle and
			contraction is stronger but of a longer duration
		2	Contractility – the ability to shorten forcibly
			Extensibility – the ability to be stretched
			Elasticity – the ability to resume resting length (of the muscle
			fiber) after being stretched
		5.	Automaticity – the ability of a muscle to contract without a
			nerve supply
	G.	-	ctions
		1.	Movement – locomotion/manipulation, heartbeat, moving
		~	substances through hollow organs
			Posture maintenance
			Joint Stabilization Heat generation
			Protection of some internal organs
Ш.	Type		Muscles
			diac (see the Internal Heart Diagram)
			Forms walls of heart
		2.	Contracts to circulate the blood
		3.	Striated (banded) with lots of mitochondria
		4.	Involuntary – functions without conscious thought or control
			(autonomic nervous system control)
		5.	Efferent nerves control the rate of contraction based on the
		~	needs of the body
		6.	Afferent nerves are concerned with the sensations of pain,
		7	spasm, and stretch Contracts at a steady rate, except for brief, rapid bursts
	в		eral/smooth
	υ.		Found in the internal organs of the body, such as the digestive
			system, respiratory system, blood vessels, and eyes
		2.	Walls of hollow, visceral organs
			No striations = smooth
		4.	Involuntary – function without conscious thought or control
		_	(autonomic nervous system control)
		5.	Efferent (motor) neurons are less important

6. Afferent nerves are concerned with the sensations of pain, spasm, and stretch 7. Steadies constant contractions, automaticity C. Skeletal (see the Anterior/ Posterior Muscle diagram) 1. 40% of the body 2. Attaches to and cover the bony skeleton 3. Longest fibers of all the muscle cells 4. Striated 5. Voluntary – a person has control over their actions (central and peripheral nervous system control) 6. Efferent nerve fibers from the brain and spinal cord send impulses for contraction 7. Afferent nerve fibers from the muscle send message to CNS to inform brain of the degree of contraction 8. Contracts rapidly, tires easily; tremendous power, adaptable 9. Causes body movement IV. Methods of Attachment of Skeletal Muscle to Bone A. Tendon 1. Strong, tough connective tissue cord 2. Example - the Achilles tendon which attaches the gastrocnemius muscle on the calf of the leg to the heel bone B. Fascia 1. A tough, sheet-like membrane 2. Covers and protects tissues 3. Example – the lumbodorsal fascia which surrounds the deep muscles of the trunk and back C. Aponeurosis – a broad, flat sheet D. Raphe – a seam of fibrous tissue E. Origin and insertion 1. When muscles attach to bones, one end becomes the origin and one end becomes the insertion 2. Origin – the end that does not move; usually proximal to insertion 3. Insertion – the end that moves when muscle contracts F. Direct (fleshy) – the epimysium is fused to the periosteum or perichondrium G. Indirect – more common due to its durability and size 1. Connective tissue wrappings extend to form tendons; aponeurosis 2. Anchors muscle to the connective tissue of bone or cartilage, the fascia of other muscles, or the raphe V. Gross and Microscopic Anatomy of Skeletal Muscle (see the Basic Muscle Structure Diagram) A. Each muscle is an organ B. There are 100s to 1000s of muscle fibers per muscle C. Connective tissue, blood vessels, and nerve fibers

	1.	nective tissue wrappings Endomysium – a fine sheath of areolar connective tissue around each muscle fiber
		Perimysium – a collagenic sheath around several muscle fibers bundled together (fascicles) Epimysium – a dense, fibrous connective tissue surrounding
	4.	the entire muscle Deep fascia – a fibrous connective tissue that binds muscles into functional groups and wraps other structures
	E. Nerv	ve and blood supply (see the Neuromusclar Junction Diagram)
	1.	Each muscle fiber has nerve endings to control its activity Each muscle has one artery and one or more veins due to its
		tremendous energy needs and metabolic waste production
	3.	Enters the central part of the muscle and branches throughout the connective tissue, including the endomysium for each
		muscle fiber
	F. Arra	ngement of the fascicles
		Determines range of motion and power
		Results in muscles with different shapes and functional
		capabilities
	3.	The more fibers "packed" in, the more powerful
		The more parallel the fibers are to the long axis of the muscle, the more they can shorten
	5.	Parallel – the fascicles are parallel with the longitudinal axis of the muscle, such as the stylohyoid muscle of the neck
	6.	Pennate (feather-like) – the fascicles are short in relation to the entire length of the muscle, and the tendons extend almost the entire length of the muscle
	7	•
	7.	Convergent – broad origin; the fascicles converge toward a single tendon, i.e. pectoralis major
	8	Circular – fascicles in concentric rings, i.e. sphincters –
	0.	surround external body openings (orbicularis oris, orbicularis
	0	oculi)
	9.	T-tubules – where the sarcolemma penetrates the cell to form
		a hollow, elongated tube; conducts nerve impulses to the
м		deepest regions of the muscle cell
VI.	•	siology of Skeletal Muscle Contraction
		rgy sources
		The Breakdown of adenosine triphosphate (ATP)
		ATP $<$ \rightarrow ADP + PO ₂ + energy
	ა.	Energy for resynthesis comes from the breakdown of
		carbohydrates, i.e. glycogen or glucose, which then results in
	Л	the formation of pyruvic acid
	4.	Results depend upon the amount of oxygen available
		 a. During moderate activity with adequate amounts of oxygen – a pyruvic acid is converted to CO₂ + H₂O +
		$\nabla y = 1 - a py (u) = a (u) = 0 = 0 = 10 = 0 = 0 = 0 = 0 = 0 = 0 = $

energy
 b. During strenuous activity with not enough oxygen –
pyruvic acid is converted to lactic acid = oxygen debt =
cramps
c. Oxygen debt – an extra amount of O ₂ that must be taken
in by the body for restorative processes; the difference
between the amount of O_2 needed for totally aerobic
respiration during muscle activity and the amount that is
actually used
B. Contractility
 Involves protein filaments – the actin and myosin located in the corecology
the sarcoplasm 2. Chemical changes
a. Nerve impulse alters the sarcolemma
b. Sodium enters the cell and causes the release of calcium
from the sarcoplasmic reticulum
c. Calcium combines with troponin on the actin to cause
contraction
d. Relaxation of the muscle requires energy to transport
calcium back into the sarcoplasmic reticulum
3. Electrical changes
a. Clinical significance – diagnostics, i.e. EKG, EEG, EMG
 All or none law – each muscle cell, when stimulated,
gives a total response or does not contract at all
 c. Strength depends on the number of muscle cells
stimulated and the condition of the muscle
C. Force of contractions
1. The number of muscle fibers contracting
2. The relative size of the muscle (regular exercise increases
strength by causing muscle cells to hypertrophy)
 Series-elastic elements – the muscle must be attached to movable structures and the connective tissues must be pulled
taut (stretch and recoil); transfer tension to the load
4. Degree of muscle stretch – a severely stretched muscle
cannot develop tension
D. Muscle tone
1. Steady partial contraction is present at all times
2. State of tension when awake
3. State of readiness to act; enables muscles for immediate
response
4. Does not produce an active movement
5. Keeps muscles firm and healthy
6. Stabilizes the joints
7. Maintains posture
8. Loss of muscle tone
a. Can occur in severe illnesses such as paralysis and

 palsy b. When muscles are not used for a long period of time – atrophy, waste away (degeneration and loss of mass) c. Complete immobilization of muscle (complete bed rest or loss of neural stimulation or in a cast) – strength decreases 5% per day; paralysis = atrophy to ¼ the initial size; the muscle tissue is replaced by fibrous connective tissue – muscle rehabilitation is impossible; delay with electrical stimulation d. Lack of use can result in contracture (permanent contraction of the muscle due to spasm or paralysis) i. Severe tightening of a flexor muscle ii. Results in bending of a joint iii. When no ATP is available, the state of continuous contraction results because crossbridges are unable 	
to detach	
iv. Foot drop = common	
 v. Fingers, wrists, and knees, as well as other joints, 	
can be affected	
9. Rigor mortis – the muscle shortens, becoming rigid due to a	
decrease in ATP	
10. Muscle fatigue	
a. The muscle is unable to contract	
b. Tension drops to zero	
c. Inability to generate enough ATP to power the contractile	
process	
d. A relative deficit of ATP, not a total absence	
e. An excessive accumulation of lactic acid and ionic	
imbalances	
11. Spasm – a sudden, involuntary contraction of a muscle	
Clonic – a spasm alternating with relaxation	
13. Tonic – sustained	
14. Tetanus – a smooth, sustained contraction	
15. Tetany – the result of low calcium	
a. increases the excitability of neurons	
b. loss of sensation, muscles twitching, convulsions	
 c. if untreated – spasms of the larynx, respiratory paralysis, 	
and death	
E. Sliding Filament Theory	
1. The individual sarcomeres shorten, the myofibrils shorten, and	
the whole cell shortens	
2. The thin filaments slide past the thick filaments so that actin	
and myosin overlap	
3. The muscle fibers are activated by the nervous system,	
crossbridges attach to the active (myosin binding) sites on	
actin, pulling the thin filaments toward the center of the	

	sarcomere (multiple attachments and detachments); this
	requires calcium
4.	Crossbridge attachment, power stroke, crossbridge
	detachment, "cocking" of the myosin head
5.	A single power stroke of all crossbridges in the muscle results
	in the shortening of only 1% (most muscles shorten 30%-
	35%); therefore, multiple attach-detach sequences are needed
6.	Actin – myosin is irreversibly crosslinked due to a calcium
	influx into the cell
7.	Rigor mortis – illustrates that crossbridge detachment is ATP-
	driven; the muscles begin to stiffen 3-4 hours after death; peak
	rigidity at 12 hours; the stiffness dissipates over the next 48-60
	hours
	or none response
1.	Once the muscle fiber has been stimulated to contract, it will contract to its fullest extent
2	Each muscle is served by at least one motor nerve, which
۷.	contains hundreds of neuromuscular junctions within each
	single muscle fiber
3.	A motor neuron and all the muscle fibers that it supplies are
	called a motor unit
4.	When a motor neuron fires, all the muscle fibers that it
	innervates respond by contracting
5.	There are an average 150 muscle fibers per motor unit
6.	There are four to several hundred muscle fibers per motor unit
	for fine motor control, i.e. controlling finger and eye
	movements
	iromuscular junction
	The motor neurons stimulate muscle fibers
2.	The axons divide and end at each of the single muscle fibers,
2	forming the neuromuscular junction
	Synaptic cleft – calcium and acetylcholine (neurotransmitter) fill the cleft, attach to the receptors, and stimulate the muscle
	fiber to contract (ACh is broken down immediately)
4	Curare (used for intubation anesthesia) and organophosphate
	poisons bind to the receptor sites and block ACh attachment
VII. Interactio	ons of Skeletal Muscles
	scles do not act independently
	ne Mover/Agonist
1.	Provides the major force for producing a specific movement
2.	Initiates movement
	Example – biceps brachii—elbow flexion
C. Anta	•
	Opposes or reverses a particular movement
	Example – triceps brachii—elbow extension
D. Syn	ergist

- 1. Aid the agonists by promotion of the same movement, or by reducing undesirable or unnecessary movements
- 2. Example muscles which help make a fist without bending the wrist
- E. Fixator
 - 1. Synergists which immobilize a bone or a muscle origin
- 2. Example muscles to stabilize the scapula
- VIII. Actions or Movements of Skeletal Muscles
 - A. Goniometry the measurement of joint movement
 - B. Adduction moving a body part toward the midline
 - C. Abduction moving a body part away from the midline
 - D. Flexion decreasing the angle of a joint
 - E. Extension increasing the angle of a joint
 - F. Hyperextension increases the angle beyond the anatomical position
 - G. Circumduction the distal end of an extremity inscribes a circle while the shaft inscribes a cone
 - H. Rotation revolving a body part about the longitudinal axis
 - 1. Internal move toward the midline, or medially
 - 2. External move away from the midline, or laterally
 - I. Supination turn the palm upward; "what's up?"
 - J. Pronation turn the palm downward
 - K. Inversion turn the plantar surface away from the midline
 - L. Plantar flexion (extension) move the sole of the foot downward, as in standing on the toes
 - M. Dorsiflexion move the sole of the foot upward
- IX. Muscle Nomenclature
 - A. Location, i.e. external oblique, pectoralis
 - B. Origin and insertion, i.e. brachioradialis, occipitofrontal
 - C. Number of heads, i.e. biceps, triceps
 - D. Function, i.e. ulnar flexor (flexes the wrist), buccinator (the cheek muscle used to blow a trumpet)
 - E. Size, i.e. vastus medialis
 - F. Shape, i.e. deltoid
 - G. Orientation of the muscle fiber bundles, i.e. rectus abdominus (the straight muscle of the abdomen), orbicularis oris (the circular muscle around the mouth)
 - H. Adjectives to describe muscles
 - 1. bi, tri, quadri 2, 3, 4
 - 2. Externus exterior
 - 3. Gracilis slender
 - 4. Latissimus wide
 - 5. Longissimus long
 - 6. Longus long
 - 7. Medius intermediate
 - 8. Orbicularis around

- 9. Quadratus square
- 10. Rectus straight
- 11. Rhomboideus diamond shaped
- 12. Scalenes irregular triangle
- 13. Teres round
- 14. Transverse crosswise
- 15. Vastus great

Activity

- I. Make flash cards of muscular terms and practice putting the terms together with prefixes and suffixes to make new terms.
- II. Complete Worksheet over the Muscular system
- III. Complete the Medical Terminology Worksheet
- IV. Review media terms with the students using review games such as the "Fly Swatter Game" or the "Flash Card Drill" (see the Medical Terminology Activity Lesson Plan -

http://texashste.com/documents/curriculum/principles/medical_terminology_activities.pdf)

V. Research and report on diseases and disorders from the Muscular system.

Assessment

Successful completion of the activities

Materials

Muscular System worksheet Medical term worksheet

Accommodations for Learning Differences

For reinforcement, the students will color and label a diagram of the muscles of the body.

For enrichment the students will research and report on a neuromuscular disease.

National and State Education Standards

National Healthcare Foundation Standards and Accountability Criteria Health care workers will know the various methods of giving and obtaining information. They will communicate effectively, both orally and in writing.

TEKS

130.203 (c)(1)(A) identify abbreviations, acronyms, and symbols;

130.203 (c)(1)(B) identify the basic structure of medical words;

130.203 (c)(1)(C) practice word-building skills;

130.203 (c)(1)(D) research the origins of eponyms;

130.203 (c)(1)(E) recall directional terms and anatomical planes related to body structure;

130.203 (c)(1)(F) define and accurately spell occupationally specific terms such as those relating to the body systems, surgical and diagnostic procedures, diseases, and treatments.

130.203 (c)(2)(A) demonstrate appropriate verbal and written strategies such as correct pronunciation of medical terms and spelling in a variety of health science scenarios;

130.203 (c)(2)(B) employ increasingly precise language to communicate; 130.203 (c)(2)(C) translate technical material related to the health science industry.

130.203 (c)(3)(A) examine medical and dental dictionaries and multimedia resources;

130.203 (c)(3)(B) integrate resources to interpret technical materials;

130.203 (c)(3)(C) investigate electronic media such as the Internet with appropriate supervision.

130.203 (c)(4)(A) distinguish medical abbreviations used throughout the health science industry; and

130.203 (c)(4)(B) translate medical abbreviations in simulated technical material such as physician progress notes, radiological reports, and laboratory reports.

College and Career Readiness Standards

English/language art

B.1 Identify new words and concepts acquired through study of their relationships to other words and concepts.

B2. Apply knowledge of roots and affixes to infer the meanings of new words.

B3. Use reference guides to confirm the meanings of new words or concepts.

Cross- Disciplinary standards-Foundational Skills

A2. Use a variety of strategies to understand the meanings of new words

Muscular System Worksheet

Na	ne Period	
1.	Muscle tissue has five properties. What are they? Define them.	
	a	
	b	
	C	
	d	
	е	
2.	List the four basic functions of the muscular system.	
	a	
	b	
	С	
	d	
3.	Three types of muscle tissue are found in the human body. What are they? W	here
	s each type found?	
	a	
	b	
	C	
4.	Define Tendon.	
5.	Define Fascia.	
6.	dentify the following:	
	a. Muscle fatigue	

	o. Spasm				
	c. Clonic				
	d. Tonic				
	e. Tentanus				
	f. Tetany				
7.	Choose the type of muscle tissue that fits each descriptive phrase.				
	C = Cardiac Muscle S = Smooth Muscle SK = Skeletal				
	a. Forms the bulk of the wall of the heart				
	b. Has intercalated discs				
	c. Involuntary, nonstriated				
	d. Involuntary, striated				
	e. Located in walls of hollow internal surfaces such as the blood ves	sels			
	f. Exhibits autorhythmicity				
	g. Requires a constant supply of oxygen so the mitochondria are lar	ger			
	and more numerous				
	h. Is slower to contract than the other two tissue types				
	I. Does not have sarcomeres				
8.	Describe the "sliding filament theory."				
9.	Define these terms:				
	a. Origin				
	b. Insertion				

10. Define the roles of the prime mover (agonist), antagonist, synergist, and fixator in producing body movements.

- 11. What would happen if the flexors of your forearm were functional, but the antagonistic extensors weren't?
- 12. What action would occur if both the flexors and extensors contracted simultaneously?
- 13. What is the location of the pectoralis major, deltoid, and latissimus dorsi muscles? All three of these muscles are (superficial / deep). They are all directly involved with movement of the (shoulder girdle / humerus / radius/ ulna).
- 14. Write the names of the muscles that fit these descriptions.
 - a. Covers most of the posterior of the humerus.
 - b. The largest muscle of the chest region; used to throw a ball in the air (flex the humerus) and to adduct the arm.
 - c. Bows and rotates head from side to side. _____
 - d. Controls action at the elbow for a movement such as the downstroke in hammering a nail.
 - e. Flexes the forearm.
 - f. Hyperextends the humerus, as in doing the "crawl" swimming stroke.
 - g. Moves the shoulders by raising them and pulling them back; helps hold the head erect
 - h. Abducts the arm _____

Muscular System Worksheet – Answer Key

- 1. a. Contractility the ability of muscle tissue to shorten and produce force
 - b. Extensibility the ability of muscle tissue to be stretched with very little application of force from the opposing muscle group
 - c. Elasticity the ability of muscle tissue to return to its normal resting length from its extended position without additional energy requirements
 - d. Excitability the ability of muscle tissue to receive and respond to stimuli (electrical)
 - e. Automaticity the ability of muscle to contract without a nerve supply
- 2. Motion, maintenance of posture, heat production, stabilization of joints, protection
- 3. a. Skeletal muscle tissue attached to the bones and moves parts of the skeleton. It is striated and voluntary
 - b. Cardiac muscle tissue forms the bulk of the heart wall. It is striated and involuntary
 - c. Smooth (Visceral) muscle tissue located in the walls of hollow internal structures such as blood vessels, the stomach, and the intestines. It is non-striated and involuntary
- 4. Tendon muscular connective tissue in a cord-like formation
- 5. Fascia a tough, sheet-like membrane that covers and protects
- 6. a. Muscle fatigue a muscle unable to contract, with the inability to produce ATP
 - b. Spasm a sudden, involuntary contraction of a muscle
 - c. Clonic an alternating spasm and relaxation
 - d. Tonic sustained
 - e. Tetanus a smooth sustained contraction
 - f. Tetany the result of low calcium, which increases the excitability of neurons
- 7. a. cardiac f. smooth
 - b. cardiac g. cardiac c. smooth h. smooth
 - d. cardiac i. smooth
 - e. smooth
- 8. The sliding filament theory states that the weakest stimulus from a neuron that can initiate a contraction is the threshold stimulus. Once a threshold stimulus is applied, individual muscle fibers of a motor unit will contract to their fullest extent or will not contract at all. Individual muscle fibers do not partly contract.
- 9. a. The attachment of a muscle tendon or aponeurosis to a stationary bone b. The attachment of a muscle tendon or aponeurosis to a movable bone

- Prime mover a muscle that causes a desired action Antagonist – the muscle which has an opposite effect as that of the prime mover Synergist – a muscle which serves to steady a movement, preventing unwanted movements; helps the prime mover be more efficient
 Fixator – a muscle which stabilizes the origin of the prime mover
- 11. Your arm would flex, but would be unable to relax and extend
- 12. No action would occur there would be no movement at the elbow joint
- 13. superficial, shoulder girdle
- 14. a. Triceps brachii
 - b. Pectoralis major
 - c. Sternocleidomastoid
 - d. Triceps brachii
 - e. Biceps brachii
 - f. Latissimus dorsi
 - g. Trapezius
 - h. Deltoid

Muscular System Medical Terminology

Write the meaning of each term in the spaces provided below.

hemiplegiahalf paralyzed (which usually refers to the left side or the right side of the body being paralyzed)hypertrophyoverdevelopmentkinesiologystudy of movement or motionleiomyomatumors of the smooth musclemyalgiamuscle painmyocardiumreferring to the heart musclemyomatumor of the musclesmyomatumor of the musclesmyometriummuscular uterine tissue	fascia	fascia or fibrous bands
Inemplegiabody being paralyzed)hypertrophyoverdevelopmentkinesiologystudy of movement or motionleiomyomatumors of the smooth musclemyalgiamuscle painmyastheniamuscle weaknessmyocardiumreferring to the heart musclemyomatumor of the musclesmyometriummuscular uterine tissue	fibromyalgia	pain in the muscle fibers
kinesiologystudy of movement or motionleiomyomatumors of the smooth musclemyalgiamuscle painmyastheniamuscle weaknessmyocardiumreferring to the heart musclemyomatumor of the musclesmyometriummuscular uterine tissue	hemiplegia	
leiomyomatumors of the smooth musclemyalgiamuscle painmyastheniamuscle weaknessmyocardiumreferring to the heart musclemyomatumor of the musclesmyometriummuscular uterine tissue	hypertrophy	overdevelopment
myalgiamuscle painmyastheniamuscle weaknessmyocardiumreferring to the heart musclemyomatumor of the musclesmyometriummuscular uterine tissue	kinesiology	study of movement or motion
myastheniamuscle weaknessmyocardiumreferring to the heart musclemyomatumor of the musclesmyometriummuscular uterine tissue	leiomyoma	tumors of the smooth muscle
myocardiumreferring to the heart musclemyomatumor of the musclesmyometriummuscular uterine tissue	myalgia	muscle pain
myomatumor of the musclesmyometriummuscular uterine tissue	myasthenia	muscle weakness
myometrium muscular uterine tissue	myocardium	referring to the heart muscle
	myoma	tumor of the muscles
myorrhexis rupture of the muscles	myometrium	muscular uterine tissue
	myorrhexis	rupture of the muscles

paraplegia	beyond paralysis (refers to the paralysis of two limbs, usually the legs)
perimysium	pertaining to around the muscles
phrenic	pertaining to the diaphragm
quadriplegia	paralysis of four (referring to the paralysis of all four limbs)
sarcolemma	muscle (flesh) membrane
tachycardia	rapid heart
tendinitis	inflammation of the tendon
tendinoplasty	surgical repair of the tendon
tetanus	condition of stiffness (refers to constant muscle contractions)

Medical Abbreviations

amb	ambulate
CNS	central nervous system
GI	gastrointestinal
HR	heart rate
IM	intramuscular
К	potassium
kg	kilogram
lb	pound
MI	myocardial infarction
Na	sodium
Р	pulse
PK	pain killer
RICE	rest, ice, compression, and elevation
