# NOTES: Chapter 1 - Exploring Life

• The phenomenon we call life defies a simple, one-sentence definition

• We recognize life by what living things DO

Concepts / Themes in the	e Study of Life	
Concept 1.1: a set of T piology!	HEMES/ big ideas pe	ervade all of biology – make connections across different areas o
• THEME: new properties	emerge at each level	I in the <b>biological hierarchy</b>
From the	to	to
Life is organized (ORDE	R) on many structura	al levels (small to large):
·		_ •
Biological Molecul	es	•
- 		Organ Systems
		•
Levels beyond the indivi	dual organism:	- •
Levels beyond the individ	dual organism:	•• •
Levels beyond the individual of the indin of the individual of the individual of the individual of the	dual organism:	•• •• with other organisms and the physical environment system
• <u>THEME</u> : organisms • <u>THEME</u> : organisms • <u>THEME</u> : life requires	dual organism: trients within an ecos	• • with other organisms and the physical environment system and transformation
Levels beyond the individual of the indin of the individual of the individual of the individual o	dual organism: trients within an ecos	with other organisms and the physical environment system and transformation
Levels beyond the individual of the indin of the individual of the individual of the individual o	dual organism: trients within an ecos ecosystem (sunlight	with other organisms and the physical environment system and transformation → plants → animals)
Levels beyond the individual • • <u>THEME</u> : organisms • ex: cycling of chemical nu • <u>THEME</u> : life requires -all organisms must -flow of energy through an <u>THEME:</u> STRUCTURE AN	dual organism: trients within an ecos ecosystem (sunlight ID FUNCTION are co	•     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •     •

• Biological systems are much more than the sum of their parts

→ A system is a combination of components that form a more complex organization

THEME: the cell is an organism's basic unit of structure and function

• The cell is the lowest level of organization that can perform all activities required for life

#### The Cell's Heritable Information:

• Cells contain chromosomes made partly of DNA, the substance of genes which program the cells' production of proteins and transmit information from parents to offspring

THEME: the continuity of life is based on heritable information in the form of DNA

• The molecular structure of DNA accounts for it information-rich nature

## THEME: Feedback Mechanisms Regulate Biological Systems

- A kind of supply-and-demand economy applies to some of the dynamics of biological systems
- In feedback regulation the output, or product, of a process regulates that very process

#### In negative feedback:

An accumulation of an end product \_\_\_\_\_\_ that produces that product

#### In positive feedback:

The end product

## THEME: Evolution is the overarching theme of biology!

## ▶ Concept 1.2: EVOLUTION accounts for life's unity and diversity

- The history of life is a saga of a changing Earth billions of years old
- The evolutionary view of life came into sharp focus in 1859 when Charles Darwin published <u>On the Origin of</u> <u>Species by Natural Selection</u>
- The Origin of Species articulated two main points

• The products of natural selection are often exquisite adaptations of organisms to the special circumstances of their way of life and their environment

#### Diversity and unity are the dual faces of life on earth:

- **TAXONOMY** = branch of biology concerned with \_\_\_\_\_\_\_. -This helps categorize the diversity to make it manageable.
- Unity of life is evident in:

-Similar		
-Similarities in		

▶ Classifying Life: Biologists explore life across its great diversity of species

• Diversity is a hallmark of life

## \*\*Unity in the Diversity of Life:

- As diverse as life is there is also evidence of remarkable unity
- ▶ Concept 1.3: Biologists use various forms of inquiry to explore life
- At the heart of science is

-A search for information and explanation, often focusing on specific questions

• Biology blends two main processes of scientific inquiry

**Discovery Science:**  Describes natural structures and processes as accurately as possible through careful observation and analysis of data Types of DATA: Data -Can be \_\_\_\_\_\_ or \_\_\_\_\_\_ Hypothesis-Based Science (INQUIRY): In science, inquiry that asks specific questions usually involves the proposing and testing of hypothetical explanations, or **hypotheses**  In science, a hypothesis -is a tentative answer to a well-framed question, an explanation on trial Hypotheses in Scientific Inquiry: • A scientific hypothesis must have two important gualities: -It must be -It must be \_\_\_\_\_ A Case Study in Scientific Inquiry: Investigating Mimicry in Snake Populations (see textbook for figures) • In one type of mimicry a harmless species resembles a harmful species In this case study -Mimicry in king snakes is examined -The hypothesis predicts that predators in non-coral snake areas will attack king snakes more frequently than will predators that live where coral snakes are present RESULTS 100 lakiltrik 🖃 To test this mimicry hypothesis researchers made hundreds of artificial snakes, aby and furning of solal attendes an experimental group resembling king snakes and a control group of plain Samo and building and and 20**3** and the fail brown snakes 82 After a given period of time the researchers collected data that 2293 fit a key prediction 361 Canal anteless. Eleral accelerat **Limitations of Science** sissan/ and the second • Science cannot address supernatural phenomena

-Because hypotheses must be testable and falsifiable and experimental results must be repeatable

## **Theories in Science:**

• A scientific theory -ls -Generates new hypotheses -ls \_\_\_\_\_

▶ Concept 1.4: Science benefits from a cooperative approach and diverse viewpoints

• Science is a social activity!

-Scientists work together & share their results with the scientific community

• Building on the work of others

-

-Biologists approach questions at different levels

"We cannot say to ourselves, we need this or that sort of technology, therefore we should be doing this or that sort of science...Science is useful, indispensable sometimes, but whenever it moves forward it does so by producing a surprise; you cannot specify the surprise you'd like."

!

-Lewis Thomas, scientist/writer

"We know very little, and yet it is astonishing that we know so much, and still more astonishing that so little knowledge can give us so much power."

-Bertrand Russell (1872-1970), Philosopher, mathematician
