

# RELATIONSHIPS WITHIN TRIANGLES

Geometry Unit 5

# MIDSEGMENTS OF A TRIANGLE

# WHAT IS A MIDSEGMENT?

- A midsegment connects the midpoints of two segments of a triangle.
  - Given diagram below:

# CONSTRUCTION OF A MIDPOINT

- <http://www.mathsisfun.com/geometry/constructions.html>

# OBSERVATIONS

- What do you notice about the midsegments you created?
  - Lengths?
  - Lines?
  - Parallels?
  - Perpendiculars?
  - Intersections?

# PROPERTIES OF MIDSEGEMENTS

- Midsegment Theorem:
  - The segment that joins the midpoints of a pair of sides of a triangle is:
    - Parallel to the third side
    - Half as long as the third side

$R, S, T, U$  are midpoints of sides of triangles  $\triangle XPO$  and  $\triangle YPO$ .

Complete the following:

1. If  $OP = 12$ , then  $RS = \underline{\hspace{1cm}}$  and  $TU = \underline{\hspace{1cm}}$ .
2. If  $RS = 8$ , then  $TU = \underline{\hspace{1cm}}$ .
3. If  $RS = 2x$  and  $OP = 18$ , then  $x = \underline{\hspace{1cm}}$  and  $TU = \underline{\hspace{1cm}}$ .
4. If  $OP = 4x$  and  $RS = 6x - 8$ , then  $x = \underline{\hspace{1cm}}$ .
5. Consider triangle  $\triangle XYZ$  with vertices  $X(1, 1), Y(5, 5), Z(3, 9)$  and midpoint  $M$  on  $\overline{XZ}$ .

# USEFULNESS

- When would you use the midpoints of a triangle?
  - When trying to determine relationships within a triangle.
  - When trying to solve for a variable or a length
  - Application problems when needing to cut across the center and find the distance.

# PERPENDICULAR BISECTORS IN A TRIANGLE

# WHAT IS A PERPENDICULAR BISECTOR?

- Perpendicular bisectors:
  - Divide the line segment into two congruent parts
  - Intersects the line at a right angle

# CONSTRUCTION OF A PERPENDICULAR BISECTOR

- <http://www.mathsisfun.com/geometry/constructions.html>

# PERPENDICULAR BISECTORS

- What do you notice about the perpendicular bisectors of the triangles?
  - Lengths?
  - Lines?
  - Parallels?
  - Perpendiculars?
  - Intersections?

# PRACTICE

- On triangles three and four on your worksheet create the perpendicular bisectors for the triangles.

# CIRCUMCENTER

- The point of concurrency of the three perpendicular bisectors of the sides of a triangle.
- This point will be equidistant from each vertex.

# CIRCUMCENTER

- What will the circumcenter look like in the following triangles?
  - Acute?
  - Right?
  - Obtuse?
    - How do you know? Do these findings make sense?

# ANGLE BISECTORS IN TRIANGLES

# WHAT IS AN ANGLE BISECTOR?

- An angle bisector is a ray or segment which cuts an angle into two congruent angles.

# CONSTRUCTION OF AN ANGLE BISECTOR

- <http://www.mathsisfun.com/geometry/constructions.html>

# OBSERVATIONS

- What do you notice about the angle bisectors of the triangles?
  - Lengths?
  - Lines?
  - Parallels?
  - Perpendiculars?
  - Intersections?

# INCENTER

- The incenter is the point of concurrency of all three angle bisectors of a triangle.
- The incenter is equidistant from all the edges of the triangle.

# INCENTER

- What will the incenter look like in each of the following triangles?
  - Acute?
  - Right?
  - Obtuse?
  - How do you know?

# MEDIANS IN TRIANGLES

# WHAT IS A MEDIAN?

- A median of a triangle is the line segment which joins a vertex to the midpoint of the opposite side.

# CONSTRUCTION OF A MEDIAN

- How could you use your compass and protractor to create a median of a triangle?
  - Lets practice on one of the triangles on your paper.

# OBSERVATIONS

- Do the three medians meet in a point?
  - YES! We call this the centroid of the triangle.
    - What do we notice about the centroid of the triangle?
      - Lengths?
      - Angles?
      - Segments?

# CONCURRENCY OF MEDIANS THEOREM

- States the medians of a triangle will intersect in a point that is  $\frac{2}{3}$  the distance from the vertices to the midpoint of the opposite side.

# CONCURRENCY OF MEDIANS OF A TRIANGLE

# ALTITUDES IN TRIANGLES

# WHAT IS AN ALTITUDE?

- The line segment from a vertex perpendicular to the opposite side.

# CONSTRUCTION OF AN ALTITUDE

- Can I construct the altitude of a triangle?
- How!!!!!!??????
- <http://www.mathsisfun.com/geometry/construct-perpnotline.html>

LETS TRY!!!

- Lets create the altitudes of the three angles in one of the triangles on your page.
- What do you notice about the altitudes?

# ORTHOCENTER

- The point of concurrency of the altitudes of a triangle is called the orthocenter.
  - What do you notice about the orthocenter of the following triangles:
    - Acute
    - Obtuse
    - Right

# OBSERVATIONS

# CONSTRUCTIONS

- On your triangle page, find the following for a single triangle. You may want to erase your marks after each.
  - Circumcenter
  - Incenter
  - Centroid
  - Orthocenter

## GROUP WORK

- After you have completed each of the constructions and have them clearly labeled.
  - Note all the similarities you can about these

# SIMILARITIES

- Acute triangle- all points are inside the triangle
- Obtuse triangle- all points are outside the triangle
- Right triangle- orthocenter on vertex of right angle, circumcenter is on the midpoint of the hypotenuse

# SIMILARITIES

- For the general case of a triangle:
  - The orthocenter, circumcenter, and centroid are always collinear
  - The distance from the orthocenter to the centroid is twice the distance from the centroid to the circumcenter.

## REVIEW

- Perpendicular bisectors meet at the circumcenter.
- Angle bisectors meet at the incenter.
- Medians meet at the centroid.
- Altitudes meet at the orthocenter.

# INEQUALITIES IN TRIANGLES

# INEQUALITIES IN TWO TRIANGLES
