### Summer Math Calendar Entering Fifth Grade **Public Schools of Brookline**

### Get ready to discover math all around you this summer!

Just as students benefit from reading throughout the summer, they also benefit from engaging in regular and meaningful math activities. The Math Specialists of Brookline have created this summer math calendar to provide your child and your family with a variety of math activities to explore this summer.

Inside, you will find creative mathematics activities to try at home. The goal is for your child to have fun thinking and working collaboratively to communicate mathematical ideas. The activities reflect a range of difficulty with the intent that your child can choose the activities that are at a "just right" level. While working on these activities, ask your child how they found a solution or why they chose a particular strategy. We encourage you to approach them with curiosity and creativity.

This packet consists of 2 calendar pages (July and August) and an alternate summer math calendar that allows you to fill in your own activities. Each month's activities are organized into 28 "math boxes." You can choose which activities you and your child would like to complete on whichever day you want. We encourage your child to complete 20 boxes per month, coloring in each box as it is done. We recommend that you integrate an average of 15-20 minutes of math activities into your child's day, by completing these activities and reviewing basic facts. Return the signed calendars to your child's new teacher in September.

We hope that you enjoy the activities, extend them, create new ones, and have fun!

Public Schools of Brookline **K-8** Mathematics Department Spring 2021

## **Suggested Resources**

Ways to Practice Math Facts (using dice, index cards, deck of cards):

- Choose multiplication or division math activities on websites (see list of websites)
- Multiplication or division flashcards—identify a few facts to work on each time
- Multiplication or division triangle flashcards
- Flip 2 cards and multiply
- Practice skip counting by 3s, 4s, 6s, 7s, 8s, or 9s

# **Factors**

**Object:** Players take turns giving and receiving numbers to factor. They score points equivalent to the numbers given and the factors identified.

Number of Players: two (or whole class in two teams)

Materials: paper and pencil

**Preparation:** Have the players make a playing board, as shown below, or provide them with a copy of the playing board on page 21. The playing board has a scoring column for each player on opposite sides of the paper, and the numbers from 1 to 30 in an array in the center.

## Playing

I. Players alternate roles as picker and factorer.

- 2. On a turn as picker, a player crosses out any legal number on the playing board. (A legal number is any number that is not crossed out and which has at least one factor that also has not been crossed out.) The picker writes that number in his scoring column.
- 3. The factorer then crosses out any of the factors of the number the picker crossed out. The factorer writes all of these numbers in his scoring column. For example, if the picker crosses out 30 as the first play of the game, the factorer can cross out 1, 2, 3, 5, 6, 10 and 15. The factorer may choose to not cross out a factor of the number.
- Neither player can reuse a number that has been crossed out.
- 5. Players switch roles after each round.

SKILL AREAS:

factoring, multiples, division, multiplication, prime and composite numbers, addition

 The game ends when there are no more legal numbers to cross out. Players then add the numbers in their columns to find their total score.

## N Winning

The player with the highest total score wins.

## Playing Variations

- Have players keep cumulative sums of the numbers they acquire, rather than waiting until the end of the game to find the sum of the numbers.
- Use other numbers on the playing board; for example, 1 to 20, 1 to 35, 1 to 40.
- Allow the picker to cross out illegal numbers (numbers that have no remaining factors on the playing board). Add the rule that if the picker crosses out an illegal number, then the factorer (who now has no numbers to cross out) gets two consecutive turns as picker.

	11	12	13	14	15
	16	17	18	19	20
	21	22	23	24	25
	26	27	28	29	30

**Object:** Players roll dice to determine the numerator and denominator of a fraction. Players compare the fractions. The player with the larger fraction gets a point for that round. The player who gets 10 points first is the winner.

## Number of Players: 2 - 4

**Materials:** Dice (or cards marked 1 – 6), paper and pencil for recording the fractions and recording the scores.

## Playing:

 During a turn, each player rolls two dice (or one die two times) to create a fraction. The smaller number rolled must be the numerator, and the larger number is the denominator.
Each player writes the fraction on a paper in front of them.
The players then compare their fractions to see whose is largest. The player with the largest fraction says, "Mine". If more than one fraction are equal to each other, more than one player can say, "Mine". The player(s) with the largest fraction gets a point for that round.

3. The other players check to make sure it is (they are) the biggest. If another player believes the fraction(s) is (are) not the largest, that player can challenge. With a challenge, if the one who said, "Mine" was incorrect, the challenging player gets the point for that turn and another point for correctly explaining why it was not the largest. If the one who said, "Mine" was correct, that player can get an extra point for explaining why is was the largest.

4. Play continues until one of the players has 10 points.

## Modifications:

\*Players can choose to have either number as the numerator or denominator (allowing for improper fractions).

\*When playing with cards, make sure to have 4 of each number (1 - 6) and shuffle all the cards back in after each round. Players then pick two cards to use to make their fraction.
