# 14 • Titration Calc. and Curves

### CALCULATIONS

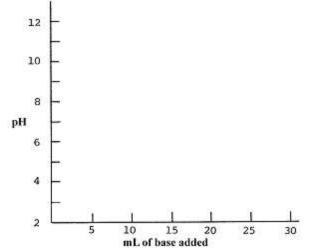

## **Information from the Curve:**

There are several things you can read from the titration curve itself. Consider this titration curve.

- This is a \_\_\_\_\_\_ (strong/weak) acid titrated with a strong base. The acid is \_\_\_\_\_\_ (monoprotic/diprotic).
   How would the other strength of acid look?
- Place a dot (•) on the curve at the equivalence point. The pH at the equivalence point is \_\_\_\_\_.
   Choose a good indicator for this titration from Figure 17.11 on page 810 of your textbook.
- 3. What volume of base was used to titrate the acid solution? \_\_\_\_\_ mL
- 4. Place a box (■) on the curve where the pH of the solution = the pKa of the acid.
  What is the pH at this point? \_\_\_\_\_
  What is the pKa of the acid? \_\_\_\_\_
  What is the Ka of the acid? \_\_\_\_\_

# **Calculations knowing the Acid:**

- 5. Hydrofluoric acid, HF, has a  $K_a = 7.2 \times 10^{-4}$ . Calculate the pH of 10.0 mL of a 0.050 M solution of HF. Plot this point on the axes.
- 6. A 0.020 <u>M</u> solution of NaOH is used for the titration. What volume will be needed to reach the equivalence point?
- 7. Write the net reaction for the neutralization of a solution of HF with a solution of NaOH.
- 8. Calculate the moles of F at the equivalence point. What is the total volume? \_\_\_\_ L

  The [F] at the equivalence point is \_\_\_\_\_
- 9. Calculate the pH of the solution at the equivalence point. Use this information and the answer to question 6 to plt the equivalence point on your graph. Choose a good indicator for this titration from Figure 17.11 on page 810 of your textbook.

- 10. What is the pH halfway to the equivalence point? Plot this point on your graph.
- 11. How many moles of HF are in the original 10.0 mL sample of HF? \_\_\_\_\_
- 12. When only 5.0 mL of 0.020 M NaOH has been added, calculate the moles of HF left and F<sup>-</sup> produced.

|   | HF | $OH^-$ | H <sub>2</sub> O | $\mathbf{F}^{-}$ |
|---|----|--------|------------------|------------------|
| i |    |        |                  |                  |
| c |    |        |                  |                  |
| e |    |        |                  |                  |

- 13. Use the Henderson-Hesselbach equation or an icebox to calculate the pH when 5.0 mL of base has been added. Plot this point on your graph.
- 14. When 20.0 mL of 0.020 M NaOH has been added, calculate the moles of HF left and F produced.

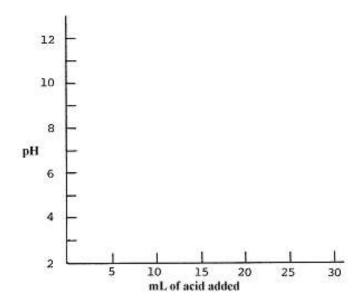

| or oddeed. |    |        |        |                  |  |  |  |
|------------|----|--------|--------|------------------|--|--|--|
|            | HF | $OH^-$ | $H_2O$ | $\mathbf{F}^{-}$ |  |  |  |
| i          |    |        |        |                  |  |  |  |
| С          |    |        |        |                  |  |  |  |
| e          |    |        |        |                  |  |  |  |

- 15. Use the Henderson-Hesselbach equation or an icebox to calculate the pH when 20.0 mL of base has been added. Plot this point on your graph.
- 16. When 30.0 mL of base is added, how many moles of OH<sup>-</sup> is in excess? \_\_\_\_\_
  The total volume is \_\_\_\_\_ L.
  [OH<sup>-</sup>] = \_\_\_\_\_
  pOH = \_\_\_\_\_ pH = \_\_\_\_
  Plot this point on your graph.
- 17. Sketch the titration curve on your graph.

## **Weak Base-Strong Acid Curve:**

A 20.0 mL sample of 0.10  $\underline{M}$  CH<sub>3</sub>NH<sub>2</sub> (methyl amine) is titrated with 0.15  $\underline{M}$  HCl. The K<sub>b</sub> for CH<sub>3</sub>NH<sub>2</sub> = 4.2 x 10<sup>-4</sup>.

Do the appropriate calculations to sketch a titration curve for this titration.

### Formulas from the AP Exam:

### **EQUILIBRIUM**

$$K_{a} = \frac{[\mathrm{H}^{+}][\mathrm{A}^{-}]}{[\mathrm{HA}]}$$

$$K_{b} = \frac{[\mathrm{OH}^{-}][\mathrm{HB}^{+}]}{[\mathrm{B}]}$$

$$K_{w} = [\mathrm{OH}^{-}][\mathrm{H}^{+}] = 1.0 \times 10^{-14} @ 25^{\circ}\mathrm{C}$$

$$= K_{a} \times K_{b}$$

$$\mathrm{pH} = -\log[\mathrm{H}^{+}], \ \mathrm{pOH} = -\log[\mathrm{OH}^{-}]$$

$$14 = \mathrm{pH} + \mathrm{pOH}$$

$$\mathrm{pH} = \mathrm{p}K_{a} + \log\frac{[\mathrm{A}^{-}]}{[\mathrm{HA}]}$$

$$\mathrm{pOH} = \mathrm{p}K_{b} + \log\frac{[\mathrm{HB}^{+}]}{[\mathrm{B}]}$$

$$\mathrm{p}K_{a} = -\log K_{a}, \ \mathrm{p}K_{b} = -\log K_{b}$$

$$K_{p} = K_{c}(RT)^{\Delta n},$$
where  $\Delta n$  = moles product gas – moles reactant gas
