## Video Notes: Ideal Gas Law

### BIG IDEAS

### DETAILS

#### Combined Gas Law

Currently we have four laws which each compare 2 properties of gases. These four laws can be combined to make one mega equation.

If you combine Gay-Lussac's, Charles' Law, and Boyle's Law, you find the combined gas law:

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

This law is used if more than one variable is changing at the same time. To use this law, moles must stay constant.

**PRACTICE QUESTION:** 322 L of hydrogen is cooled to STP (0°C and 1 atm). After cooling, the gas occupies a volume of 197 L. If the initial temperature of the hydrogen was 37°C, what was its initial pressure?

$$\begin{aligned} V_1 &= 322 \text{ L} & V_2 &= 197 \text{ L} \\ T_1 &= 273 \text{ K} & T_2 &= 310 \text{ K} \\ P_1 &= 1 \text{ atm} & P_2 &= ? \end{aligned}$$

$$P_2 = \frac{P_1 V_1 T_2}{T_1 V_2} = \frac{(1 \text{ atm})(322 \text{ L})(310 \text{ K})}{(273 \text{ K})(197 \text{ L})}$$

$$P_2 = 1.86 \text{ atm}$$

#### Ideal Gas Law

Remember that each side of the two variable gas laws equals a constant. If you combine them all and add moles to the combined gas law, pressure times volume divided by moles times temperature equals (you guessed it) a constant.

Those are the only four things we can measure about a gas - so that constant is true for all gases, under all conditions. This is the Universal gas constant, abbreviated R.

$$R = \frac{0.08206 \text{ atm} \cdot \text{L}}{\text{mol} \cdot \text{K}} = \frac{PV}{nT}$$

We can clean this up and rearrange to get the Ideal Gas Law:

$$PV = nRT$$

This gives us information about a given sample of gas under constant conditions.

**QUESTION:** How is the ideal gas law different from all the other gas laws?

no change in conditions is necessary to use it

<b>Problems</b>	<p><b>EXAMPLE PROBLEM:</b> A sample of gas is placed in a container with a volume of 2.7 L. The pressure is measured as 1.25 atm at a temperature of 295 K. How many moles of gas are in the container?</p> <p> <math>P = 1.25 \text{ atm}</math>  <math>V = 2.7 \text{ L}</math>  <math>T = 295 \text{ K}</math> </p> <p> <math>n = \frac{PV}{RT} = \frac{(1.25 \text{ atm})(2.7 \text{ L})}{295 \text{ K}} \cdot \frac{\text{mol} \cdot \text{K}}{0.08206 \text{ L} \cdot \text{atm}}</math>  <math>n = 0.14 \text{ moles}</math> </p>
	<p><b>EXAMPLE PROBLEM:</b> A sample of gas is placed in a container with a volume of 2.7 L, a pressure of 1.5 atm and a temperature of 295K. If the temperature is raised to 325K and the volume is reduced to 1.0L, what will happen to the pressure inside the container?</p> <p><b>QUESTION:</b> Which law should you use? <i>combined - conditions are changing!</i></p> <p> <math>\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}</math> </p> <p> <math>P_1 = 1.5 \text{ atm}</math>  <math>P_2 = ?</math> </p> <p> <math>V_1 = 2.7 \text{ L}</math>  <math>V_2 = 1.0 \text{ L}</math> </p> <p> <math>T_1 = 295 \text{ K}</math>  <math>T_2 = 325 \text{ K}</math> </p> <p> <math>P_2 = \frac{P_1 V_1 T_2}{T_1 V_2} = \frac{(1.5 \text{ atm})(2.7 \text{ L})(325 \text{ K})}{(295 \text{ K})(1.0 \text{ L})}</math> </p> <p style="border: 1px solid black; padding: 5px; display: inline-block;"> <math>P_2 = 4.5 \text{ atm}</math> </p>
